# engineer's staff under Mr. Burpee, A TOUR THROUGH THE INTERCOLONIAL COPPER MINE AT DORCHESTER, N. B.

Down in the Depths Seeing the Miners at Work - An Important New Brunswick Industry - What It's Like a Hundred and Fifty Feet Below the Surface.

your way down shafts, through tunnels and cross-cuts, through chambers where the ore shines in the dull light like native the ore shines in the dull light like native gems the more radiant for the rough setting? If you haven't a trip to the Intercolonial copper mine near Dorchester, in this province, would interest you as much as it did the little party to whom that pleasure was accorded last week. There were four of us in the party and the cut herewith gives an idea of what we looked like a hundred and fifty feet under ground.

mder ground. When the manager touched the flash light we thought it was a dynamite explosion which accounts for the sorrowfu look which the party wears. It was not the fear of death but rather the thought of making our exit disguised in mining togs looking like so much crushed ore.

### Big Development Quietly Going On.

idea of the development which has been quietly carried on at this mine, where a mountain of copper ore is being tunnelled, blasted, crashed, roasted, leached, and by an ingenious electric process deposited in the form of pure copper plates.

The Intercolorial copper mine is located three miles from Dorchester, and several hundreds of thousands of dollars have been expended by a strong company in sinking shafts, and making drifts and cross cuts of perhaps a mile and a half, and in building and equipping a modern mill of huge capacity.

The plant is of a designed capacity of 200 tons daily and has demonstrated its complete success in the treatment of the careless easy way an expert handles dynamite doesn't appear careful, but it is. Here and there at intervals were huge chambers hewn out of the rock whose sides and domes showed the greenish, hue of the precious metal in its carbonate form, or the equally distinct seams of the sulphide or chalcocite variety. Occasionally in extended masses we observed that tunnels branching off from the main tunnels of the careless easy way an expert handles dynamite doesn't appear careful, but it is.

Here and there as the trouble, To the novice the careless easy way an expert handles dynamite doesn't appear careful, but it is.

Here and there at intervals were huge chambers hewn out of the precious metal in its carbonate form, or the equally distinct seams of the sulphide or chalcocite variety. Occasionally in extended masses we observed the way an expert in minerals, our guide who was an expert in minerals, drew our attention to the ore bodies and to the ore stopes opened up by the lateral tunnels branching off from the main tunnels of the careless easy way an expert handles.

We made our first entry through the careless easy way an expert handles dynamite doesn't appear careful, but it is.

Here and there at intervals were huge chambers hew out of the precious metal in its carbonate form, or the equally distinct seams of the sulphide or chalcocite variety. Occasionally in exte Very few New Brunswickers have any idea of the development which has been quietly carried on at this mine, where a mountain of copper ore is being tunnelled, blasted, coushed, roasted, leached, and

The writer peered down the well-like shaft, dropped a stone to see how long it took to reach bottom, and decided that his native modesty would prevent him from following the stone. In other words we decided to make our debut on foot rather than take any chances of making it in pieces.

The writer was standing alongside the miner when he broke one of the sticks in two and a momentary glimpse in imagination of his shattered remains was driven away by the assurance of the miner that there was absolutely no danger as long as the stuff was handled carefully. But there was the trouble, To the novice

was being mined by haud drills. Two miners usually constitute a working party; one holds the drill while the other uses the shorthandled hammer. As a rule from three to five holes are driven at different angles and sticks of dynamite inserted. The blasts are set off at 12 o'clock, noon, and 4 p. m. each day. A regular hour is used as the men are unable to resume work for some little time after a blast on account of the fumes from the explowork for some little time after a blast on account of the fumes from the explosion. We examined the result of one of the blasts and found that the rock had been simply fractured instead of being blown out. This enables the miners by the use of their bars and picks to dislodge huge bodies of ore-bearing rock in large pieces so as to prevent the loss of ore if the rock were pulverized by too heavy a blast. The rock is plaged in cars which run on a railway to the mouth of which run on a railway to the mouth of one of the main tunnels, and from there is carried automatically by a tramway to

Air Pure and Fresh.

The Intercolonial copper mine has one feature which the novice notices and that is that everywhere the air is pure and fresh. This is due to the shafts which act as huge ventilators. The weirdness of men at work underground strikes one as men at work underground strikes one as he first comes on the miners at work or sees a twinkling point of light away in the distance, which betokens a couple of men with a loaded car of ore bound for daylight. The inclination is to lower one's voice in the presence of those reverberating rocks which magnify and re-echo the syllables as they fall from the lips. The assurance that a hundred and fifty feet above your head is the comfortable dining room you have recently a water gives one a hollow feeling whill you are assured that the house is founded on a rock and there is no danger of it falling

DEATHS AT HALIFAX.
