

BACTERIOLOGICAL FINDINGS IN TWENTY

Case No.	Brief History.	Origin and Nature of Material.	Microscopic Examination.
20	Foal recovering from a fairly severe attack.	Fluid from the hock joint. The fluid looked like normal synovia, was sticky, but clotted.	Numerous cells but no organisms.
21	Foal recovering from Joint-III.	Fluid from the stifle joint. Turbid yellowish fluid, which clotted.	Numerous cells.
22	Foal recovering from Joint-III.	Fluid from hock joint. Sticky brown fluid, which did not clot.	Numerous cells.
23	Foal recovering from Joint-III.	Clear sticky fluid from knee joint.	

24-34. All of these were samples of synovia received by mail. No reliance can be placed on streptococci, in some cases, spore-formers, and the pyogenic cocci. Four contained was fairly clear and not purulent. Extraneous contamination of such samples would

No. 2. The result of Joint-III. A yearling with ankylosed joints.
