abatement in the epidemic,

Apart from the miners' strike the nancial outlook in South Africa is, rather less gloomy than anticipated, Reuter's Cape Town correspondent says. While the newspapers forecast that the budget will show a deficit of four million pounds sterling, an official statement puts the figures at 1,750,000 pounds sterling.

Making Gas Mantles.

es are used yearly in the United tes, the method if lighting in which hey are employed is now familiar to every one, although it was introduced only about 20 years ago. Yet very probably there are but few persons who use the mantles who know how they are made or what they are made of Here is a brief summary:

Knitting. A thread of suitable size is knit into a tubular fabric on a machine modified from those used in knitting underwear. A large variety of stitches is made and designated as single weave, double weave, triple weave, etc.

Saturating. The lengths of knitted fabric are placed in a suitable vessel, and the so-called lighting fluid is poured over them. After the fabrii is soaked in the lighting fluid for a certain length of time it is put through an equalizer for the purpose of equalizing the amount of fluid carried by each web. The fabric is then placed upon suitable forms of glass or wood and dried.

Sewing. The fabric is now taken and folded in at one end and carefully plaited and in ashestos cord drawn through to form the head and loop of the mantle.

Modelling. After the head is made the saturated fabric is shaped over a wooden form.

Burning out. The modelled fabric s then hung on a suitable hook and ignited at the top. The thread is burned out, leaving the ash composed of the oxide of thorium and cerium.

Hardening. After the cotten is burned out the soft, flabby ash is placed over a blowpipe, where the gas and air are controlled in such a way as to blow it out in the form of a Dipping. In order to prepare the

mantle for the subsequent handling and for shipment it is dipped into a bath of collodion and allowed to dry Trimming. After the collodionized mantles are thoroughly dried they are pased to an operator, who trims off the rough edges of the skirt and reduces the mantles to a uniform length

Two Governors Resign

HIGH COST OF LIVING AND DO MINION APPOINTMENTS.

In the House of Commons recently, Mr. Churchill informed Sir Newton Moore that the Governors of South Australia and Tasmania had, to his regret, found it necessary to resign their appointments. He could not say whether this step had been taken as a result of the heavy taxation now levied in England.

Sir Newton Moore asked whether in future appointments guartees would be obtained from the governors designate as would prevent a repetition of such an unsatisfactory statet of things. Mr. Churchill said the question was

a very difficult one in view of the heavy expenditure of the appointments and the difficulty of finding suitable persons who had sufficient private
