## Pilot Superior Pipeless Furnace

The Pilot Superior Combination Register is composed of two sections; the central portion provides for a distribution of the warm air generated by the furnace, and the outer section admits the return air to the furnace. By withdrawing the cool air from the building through this outer section, the resistance to the warm air is overcome. This provides space for the rapidly expanding warm air, which circulates in large volume to all portions of the building. A vacuum cannot be created, therefore the warm air fills all the corners from which the cold air is being withdrawn.
