UNION WATER METER COMPANY METERS AT

CHATELAIN'S

FARMERS' COLUMN.

SALT FOR FARMING.—A manlius, Onandage county (N. Y.) farmer writes that last fall he sowed twenty acres to wheat, applying 225 bushels of damaged salt, and this season he has harvested from the same land 1,120 bushels of fine wheat, averaging forty bushels to an acre. He keeps eight horses, twenty-five cows, a large flock of sheep, and forty-seven hogs, and believes in genuine grain-growing, stock-raising husbandry.

GREEN FODDER.—A farmer lately informed us that he grew thirty tons of green fodder-corn on an acre. This estimate we do not doubt, for we saw it while he was feeding it out to his cows. No other forage plant named would very nearly approach that in quality and quantity combined. The next plant in regard to quantity of forage is German millet, called by some golden millet. This forage plant is highly commended by those who tried it in this section last season. While we deem fodder-corn the best supplemental forage crop for milk cows, we would not deny that the others are good.

SURFACE MANURING.—Dr. Voelcker says that on clay soils manure may be spread on the surface of plowed ground, and lie even six months without losing any appreciable quantity of fertilizing value. At the same time he advocates the plowing of long coarse manure for its mechanical effect on heavy soils, but when no alternative is left, he says it is better to spread manure at once on the soil rather than leaving it in heaps. Our own experience, during several seasons, has shown that manure spread on the snow during winter, when it could be hauled economically on sleds, has given us better crops of corn, potatoes, hay, etc., than when spread at any other time.

HARVESTING BEANS.—The following is a good way to harvest beans: "When the largest part of the pods have turned brown the vines should be pulled. The work should be done in pleasant weather—never when it is rainy or when there is a prospect of an immediate storm. This is very essential, as upon the successful curing of the crop its quality very largely depends, and it cannot be well cured in bad weather. Five or six rows may be pulled and thrown into a windrow, taking care not to pile the vines too thickly. If the weather is pleasant they may lie in this way a day or two, then be turned over and lie another day. Then if they appear to be quite dry they may be got into the barn and thrashed. But if the weather is not favorable, and the vines are not dry enough to take in, they must be stacked in the field. The best way of stacking which I have tried is to set two stakes about two and a half feet apart and between these lay the beans, tops outward. A block of wood, a large stone, or something else should be laid on the ground in order to keep the vines from contact with the earth. The stakes should be five or six feet long, and at height of three feet from the ground should be fastened together with a string or wire to prevent their spreading. When they are nearly dry the stacks should be spread out to the sun some morning, and in the afternoon, if they get well, the beans should be taken into the barn. For thrashing I use wood flails. If proper care is exercised not many of the beans will be injured, but they should not be pounded too much. The cleaning is done with an ordinary fanning mill, and should be well done in order to get out all the dust and straw."

PLANTING EVERGREENS.—There is no better season than this month for planting evergreen trees. While there is yet growing power in the tree sufficient to enable the roots to take hold of the soil and establish themselves firmly before the storms of winter, the summer's growth of wood is so matured as to bear transplanting successfully in May and June, and in August, September and October, we have had fewer failures in the latter month than in any other. Much of the success or failure of newly planted evergreens depends on the performance of the work. Some object to fall planting of evergreens, deeming that they have as yet not firmly established themselves in the ground. This may be easily prevented by care in planting and timely mulching. The trees that have adapted themselves to the soil and have by their rootlets taken hold and made a commencement at drawing the plant food from their new home, will have a great advantage the next summer over those just planted. For transplanting, take up the young trees with the roots and rootlets as free from injury as possible, and do not let them become dry from any cause till they are planted in the fresh, moist soil. Let the holes to receive them be wider and deeper than the roots seem to require; put some good earth under them, and cover the roots some inches; then with your hand pull them up a little, so that the earth will fill the vacant spaces between the roots; then put in more earth; tramp firmly; fill up the holes with the earth taken from them; tread firmly again, and the planting is completed. This is the way we plant, and we are successful in growing evergreens taken from the woods—Canadian balsams, pines, cedars, hemlocks and others—Exchange.

STOCK PEAS AS FERTILIZERS.—Farmers are just beginning to look into the merits of peas for stock and for fertilizing worn-out lands. Quite an enquiry is springing up from them, and but few can get supplies of seed. One gentleman sent to several cities, failing to get any as yet, and has sent orders to other points. The work of improving land still goes on, and unless it is checked before another quarter of a century has passed, thousands upon thousands of acres will be gone to ruin and the owners reduced to poverty. Some have tried clover, and have managed it so badly that but little good has been effected, much of the land being so wasted that they could not get a stand of clover. Failing in this, they have given up in despair and turned out many a field as wasted commons. In this condition the fields, many of them, now remain, and if returned to cultivation and sowed in stock or cow peas they could soon be restored and made valuable once more. Peas will grow on land too poor for clover, as they draw most of their food from the atmosphere, and the vines turned under are one of the very best restoratives for worn soil. As food for stock, the vine as hay and the peas as a substitute for grain are excellent, especially for fattening hogs. They may be sown now, though it had been better if sown by the first of July. And they need no cultivation, but would do well if planted in drills, three or four peas every step in a hill, and then worked once or twice. If sown broadcast and turned under as a green crop, they make a fine base for wheat late in the fall. It ought to be a point with every farmer to plant a patch each year to save for seed, while he has larger plates to save for feeding stock, as well as a larger area sown for fertilizing and restoring his lands. Clover and peas are the cheapest and most effective restorers of worn lands the farmer can get, and they ought to avail themselves of all the advantages afforded by these natural restoratives. Another thing a farmer can get his own price for what he has to spare, as the seed has to be had and the gathering is the principle trouble. We ask those farmers familiar with the different kinds of peas to tell our readers all they know about them, with full instructions of when to plant, and how to manage them to the best advantage for all purposes.—Rural Sun

FURS.

By the advice of the most Competent Judges at the

UNIVERSAL EXPOSITION

OF PHILADELPHIA,

OUR HOUSE obtained THE INTERNATIONAL MEDAL, and the only GOLD MEDAL accorded for QUALITY, TASTE, CHEAPNESS, SUPERIOR FINISH, and GREAT VARIETY OF FURS.

This incontestable success obliges us to be always improving our assortment, and we always go in person to select the BEST FURS in the Markets of St. Petersburg, Leipzig, London, etc. As MANTLES are worn much longer this year we have the honor to inform the Ladies that we have on hand a LARGE VARIETY OF TRIMMINGS for MANTLES of an entirely new fashion. Please send in your FURS that require REPAIRING before the cold weather sets in. Considering the Hard Times we have considerably REDUCED OUR PRICES.

THE MIC-MAC REMEDY

A SPECIFIC FOR SMALL-POX.

ANOTHER VICTORY FOR MAJOR LANE.

A HOPELESS CASE OF SMALL-POX CURED BY THE MIC-MAC REMEDY.

To MAJOR JNO. LANE, GREENFIELD, Mass.

DEAR SIR,—I telegraphed for a package of your Small-Pox Remedy on last Monday, which I received the following day. I would have instantly responded and forwarded the money, but thought I would wait the result of its trial. I prepared the medicine myself so as to render everything secure; and I am proud to be able to state that it produced almost instantaneous relief. It was a malignant case of Small-Pox—in fact, there was no hope of recovery expressed on any side; but by the application of your famous Remedy it easily yielded. Enclosed I send you a five dollar bill. Please acknowledge.

Your truly, Rev. W. A. HENNEBERRY.

Price \$5 per package.

Sent to any part of the Dominion, post paid on receipt of price—a liberal discount to Clergymen, Physicians and Charitable institutions.
