# Care of Children's Eyes.

Parents.

Steps Taken to Examine the Eyes of Pupils in the Public Schools-An Oculist Tells of the Importance of the Project-Necessity of Watching the Eyes of the Young,

[New York Sun.]

Nine mothers out of ten neglect the eyes of their children. The question is often asked, "Why do we see so many children wearing glasses nowadays?" Eye specialists reply with another question, "Why do we see so few young people wearing glasses?" and they answer their own question by saying, are notoriously ametropic. What do I "Because parents are so ignorant of mean by that? They are given to erthe importance of caring for the eyes of their children." The average mother looks after the teeth of her babies from almost the time that the first little grains of rice, as she calls them, make their appearance, but it does not always occur to her that her child's bright, pret eyes may be in a con-dition that will lead to poor sight or

even blindness. An effort is being made in the public schools of this city to have a care for the eyes of the children, but those interested are hampered by want of money to carry on the work. For ten years or more Superintendent Jasper been interested in looking after the eyes of the public school chudren, not merely so far as diseases of the eye are concerned, but also as to refraction, plain and simple. He says that the day is surely coming when the eyes of each individual pupil will be examined by a specialist, and those that are not normal will be properly cared for.

"Such a reform," he continued, "cannot be effected in a day or a year. It takes both time and money, but it will

Last June the president of the board of education appointed a commission of three experts among the three oculists of the city to report to the board its opinion with reference to the color most desirable for use in the new school buildings, and in others when the tints are changed. At the same time the board expressed a wish that a corps of experts might be appointed and paid by the board of health, whose duty should be to examine the children of the public schools with reference to defective sight and hearing, defective breathing, and any abnormal or defective physical

Toward the last of October Dr. Chas. Stedman Bull, Dr. Henry D. Noyes, sion, reported that they had visited a large number of schools. They suggested that it was not advisable to place blackboards on the wall directly opposite the windows in any classroom, as was done in several buildings. They ound that the blackboards were placed orrectly in most buildings, so that the ight was not reflected in the eyes of he pupils. They objected to painting the wall space between the surbase and chair rail a dark maroon, as that made a too marked contrast with the side walls. They advised the use of dark yellow or light brown without any mixtures of red, and suggested light buff tints for ceiling and side walls as satisfactory to eyes of teachers and pupils. These authorities reported that the quantity of light in a room was greatly influenced by the color on the walls, and that the red end of the spectrum should never be used in decorating schoolrooms, as much light was lost in the employment of certain colors. Lighter and more delicate shades, such as yellow or gray, were suggested as the best. The quantity of light in a room also varied greatly, and the color chosen should be estimated for the least favorable conditions. The commission advised the choice of lightcolored woods for all school furniture and the woodwork of the buildings. The building committee is doing all it can toward carrying out the suggestions of this special commission so far as concerns locating blackboards, arranging desks that the light may fall on them properly, and in decorating walls and

"That is a step in the right direction," said a prominent eye specialist in speaking of this effort of the school board, "but the care of a child's eyes should begin at home long before he enters a kindergarten.

"Really the care of the eyes should begin before the birth of one's greatgrandmother, but since our ancestors took no thought of this precaution in our favor, we must do the best we can for ourselves by having our eyes examined comparatively frequently, and by taking good care of them if they prove normal, or by treating them properly if not normal. It would shock many a mother to learn that her child is blind through her own ignorant carelessness, and yet this is true in a great many cases. Our asylums for the blind are filled with people shut out from the light because their eyes were not cared for when they were young. The educated, thoughtful mother of today who neglects a child's eyes is almost a crim-If a mother has taught herself to look at her child in the right way, his actions and speech not only denote to her the child's mentality and morality, but also the actual physical condition of the eyes. Frequently a child suffers from violent headaches and neuralgic pains, and has a peculiar manner of looking at people and objects. The ignorant mother calls this manner a 'queer habit,' says it is cute, and encourages the child to keep it up. These headaches are as common to childhood as rheumatism, which parents tell the little sufferers is nothing but growing pains, and nine times out of ten are the direct result of eye strain. Eye strain is frequent in children

This dread malady lurks behind the most insipient head colds, and when the seeds of disease are sown steals away the beauty bloom and makes

DR. AGNEW'S CATAREHAL POWDER will cure the incipient cold and the most stubborn and chronic Catarrh cases. It puts back the beauty pink and sheds sunshine in its trail. "My wife and I were both troubled with distressing Catarrh, but we have enjoyed freedom from its distresses since the first application of Dr. Agnew's Catarrhal Powder—it acts instantaneously—gives grateful relief in 10 minutes, and we believe there is no case too deeply seated to baffle it in a cure."—Rev. D. Bochnor, Bufale, 3.1.7.—32

Precautions Often Neglected by rarely recognized by mothers, though Many people ask why so many folks, particularly children, are wearing glasses today. There are three good reasons for this being the case. First of all, our ancestors were careless about our eyes, and then the methods of modern civilization are extremely trying to the eyes, and, last of all, people generally are being gradually educated to the necessity of wearing glasses. The environment of our forefathers and our own environment combined are the conditions that put glasses on o many noses.

"Take the Indians, for example. You never found an Indian raised on the plains in need of glasses for any condition of the eyes except that of old age. It is very seldom that you find a cotton field negro with other than normal eyesight. Seamen and the children of seamen have proverbially good eyes. On the other hand, the Germans rors of refraction, not eye diseases. Mark Twain may have exaggerated the state of things a little when he said a German father would not accept a child as his own unless it was born with glasses, but he was almost justi-fed in making the statement. This condition of the eyes of the Germans can be accounted for on two grounds, their studiousness and their stolldity. An American may be just as studious as a German, but he is not stolid, and while devoting himself to his books gets out, covers a lot of ground and changes his vision constantly. Not so with the German. He limits his range of vision to such a short distance that the muscle of accommodation known as the ciliary muscle, whose business it is to adapt the eye so that it may see objects close at hand, is in a constant state of contraction. There is no muscle in the body intended to be in this condition. Even the muscles of the heart have regular periods of rest. Anybody with ordinary gumption can readily understand that this poor eye muscle, overworked, overexerted, must cry out to the being which governs its action in the only way that a muscle can ery, and that is in pain. This accounts for the many conditions of so-called neuralgia and rheumatism of the head

from which our grandparents suffered through their own ignorance and the ignorance of the doctors of their time. "This continued dragging and pulling on the ciliary muscle is bound after a time to have a bad effect on so delicate an organ as the eye, and by changing or interfering with the passmyopia or nearsightedness. Many a off altogether. child can thank its mother for being near-sighted. She has encouraged it to strain over books for first honor or some silly prize and the result is a bad case of near-sightedness. The elongation of the eyeball is not as a rule congenital or hereditary, but a tendency to it certainly is, and when such is the case a confinement over books will sur-

"When a child has what is known as far-sightedness, or hypermetropia, a life led in the open is not nearly so injurious as a confined life. If a farsighted child is allowed to romp and play in the country or in the park the best part of its time, it will probably go through its whole life without any eye trouble. Far-sightedness has not tendency to increase, but most authorities agree that it turns into nearsightedness if the subject does confining work. Because a child sees as well as its playmates does not signify that it has no need for glasses. If the youngster is far-sighted, that poor little muscle in the eye is compelled to work hard all the time for distant vis-

ion, and all the harder for near vision. "The exterior appearance of a child's eye rarely shows a difference from normal in its refractive quality, unless the child has a squint or is cross-eyed. The eyes of almost every cross-eyed child, if taken in time, can be strightened permanently by the use of glasses, and the necessity of an operation and much mental irritation consequent upon continual pain avoided later in

"Mothers do not always attend promptly to signs of inflammation girl." about the eyes of their children. It is seldom that an eye specialist sees a case unless it has been referred to him sician for a slight ailment, but one by the family doctor after he has expended all his skill in endeavoring to mation, into a serious one. cure the child of headache. Few family physicians realize that most of childhood's headaches are due to eye strain. The question arises, can sufficient permanent injury come from the conditions of the eyes mentioned justify any community in expending money toward discovery and relief? Yes, ten times yes, for the reason that there are very many persons in our blind asylums today who are parasites on the municipality because their eyes the doctor, "but you may get well be-

"A child's eyes should be just as carefully observed during the period of its growth as its morality. Then is the time that the eyes are most strained. In view of the ignorance of parents, teachers and the children themselves, it would be very wise to have an ex-amination made by experienced eye specialists of the refractive condition of the eyes of every pupil in our public schools. A record of each examination should be kept, and where there is a tendency toward near-sightedness, far-sightedness or any of the conditions mentioned, the teacher in direct charge of such pupils would be instructed by the doctor as to the proper amount of eye work advisable in each case. After the system was once established there would be but little trouble. A general examination of the eyes would hardly

be necessary more than once a year. "The regular examination of a child's eyes should begin at birth and should then be made by an eye specialist. It sithout the resultant headache. It is is a simple enough matter to examine a child's eyes, and an expert does it very rapidly by means of a little in strument known as the ophthalmoscope. With only those eyes showing a condition other than normal by this instrument would it be necessary to go through a longer and more thorough examination. The moment that a mother, be she poor or rich, sees that a child's eyes are inflamed in the least she should take it to a specialist. Those who are not able to pay for advice should patronize the dispensaries where special attention is given to the eye." "Is color blindness common?" asked

the reporter. "Not very," answered the physician.
"A lot of people are color blind and yet can differentiate between colors, but not shades of color. It is only by very careful testing that color blindness can be discovered, and it is sometimes the forerunner of atrophy of the optic nerve. The sense of green goes first, then red, next blue, and finally white. A condition of color blindness is seldom called to the attention of the specialist. True, ness interests and life itself depend on a differentiation of colors, I hardly feel that it would be wise or just in proposed examination of the eyes of all children to tack upon them the stigma of being color blind.

"Mothers should not allow growing boys and girls to read or study at night, and they should train them to change the range of vision frequently. A child of 2 or 3 years can be taught that when its eyes are tired from looking at objects close to it, it will rest them to look at things off in the distance. Children should also be taught to read and study sitting in almost a vertical position, with the book nearly on a level with the eyes, and at an angle so that the light shines on it from over the shoul-der. The so-called simple remedies for are rendered more striking by the asweak and inflamed eyes should be shunned as we shun a plague. Poultices of bread and milk, camomile and tea leaves, and applications of rose water, belladonna, witch hazel and so on are very injurious. No hot or even warm applications should be used on the eyes unless directed by a specialist. More ulcers of the eye are the result of such home treatment than of any other cause. In removing foreign bodies from the eye the linseed or eyestone should never be resorted to, for, in the first place, it is liable to pass from view behind the lid, often causing additional inflammation, and then it is an excel-

go Fraser, D.D., and others sound its praises. It cures young and old. Mrs. George Graves, Ingersoil, writes: "My little daughter, aged 13 years, suffered from catarrh of the very worst kind. No physician or remedy cured, until we used Dr. Agnew's Catarrhal Powder, and after using two bottles my child was completely cured." It is a pleasant, safe and speedy remedy for Catarrh, Hay Fever, Colds, Headache, Sore Throat, Tonsilitis and Deafness. Sold by W. S. B. Barkwell and all

TOO LATE.

A young man, upon whose upper lip the first faint signs of adolescence had begun to manifest themselves, had become deeply enamored of a maiden several years his senior.

His home, and hers as well, was in an ambitious college town in the middle West, among whose municipal regulations—but let us not anticipate. He had been under the influence of the tender passion for a period certainly not less than four weeks, could wait no longer to know his fate. One eventful evening, after walking up and down the sidewalk in front o her home until nearly 9 o'clock, he went up the doorsteps, rang the bell, and was admitted. The young lady received him in the parlor, and without loss of time he declared himself in the most impassioned manner. a brief silence.

# We Eat Many Tons.

Enormous Amount of Food That Is Consumed by a Man in Seventy Years.

Meat is an important item. The man who regularly partakes of two rashers of bacon for breakfast and his chop for lunch and half a pound of steak for dinner, being required to order his life's supply of meat at birth, could put it this way: Slices of bacon to measure four miles placed end to end; chops to reach from Westminster Abbey to St. Paul's; all the beef on 20 full-sized bullocks.

Before dismissing the statistics of the food consumption for those of the drink consumption, let us take stock up to this point. Allowing our man 1½ pounds of bread each day, one pound of flesh foods, one-half pound of fish, two pounds of vegetables and fruit and one-half pounds of sundries, we have a total of 51/2 pounds of solid food daily, or nearly a ton a year! Taking this average to extend over 60 years, the exact weight of solid food consumed in a lifetime is very

hardly less startling nature. Three pints of liquid daily, a fair average consumption, taking winter and summer together. Now three pints a day develop into 1,095 pints a year, and, for a lifetime of 70 years, 76,650 pints, or, roughly, 76,700 pints, allowing for the extra days in the leap years. The weight of this 76,700 pints of liquid

Altogether, then, the healthy man, with a good appetite and average drinking capacity, assimilates into his system during 70 years 96½ tons of material, solid and liquid, or, putting it in another way, and assuming his weight to be 12 stone, he consumes over 1,280 times his own weight of nourishment in the course of a life-

## INVESTMENTS IN PHILANTHROPY

field's private secretary, undertook to demonstrate that judicious philanthro-phy "pays." He did it by opening Rowlodge at the cost of sixpence a day. managed, the house returned 5 per cent on the capital invested. The

warranted other houses. The third was opened a few weeks ago, and two more are building. In New York the same plan has been successfully applied of late by Mr. D. Ogden Mills. The Rowton House, like House," offer home comforts and something like club luxuries to the poor man who has known nothing better than the cheap lodging-house and the saloon. His sleeping-room is all his own; he has a right to the kitchen, the bath-room and the library; he can smoke and talk, write or read. The price he pays is within his means, but the fact that he does pay preserves him from the feeling of pauperism. He

they are located. "Cheap lodgings" are not so dirty or so crowded as they once were. Saloons that used to be 'the poor man's club"-as the apologetic phrase goes-attract few loungers. The street corners are almost bare of idle and mischievous men. In short, 2,000 persons directly, and many thousands indirectly, have been helped by the Rowton Houses to help themselves-and have willingly paid for

We commend the facts to the people who feel that the very poor are be-yond relief; to others, who wish to know what may be the next step in demmon-sense philanthrophy; above all, to persons who, when they invest money, like to consider not only the present personal interest but the future general good .- Youth's Companion.

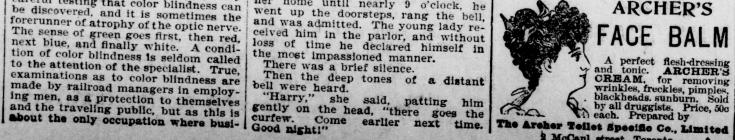

Many persons cannot take plain cod-liver oil.

They cannot digest it. It upsets the stomach. Knowing these things, we have digested the oil in Scott's Emulsion of Codliver Oil with Hypophosphites; that is, we have broken it up into little globules, or droplets.

SCOTT & BOWNE, Chemists, Toronto.

An article by Mr. P. W. Everett, Fellow of the Royal Statistical Society, in which is calculated the enormous amount of food and drink consumed by a heaithy man in a 70-year life, appears in Pearson's Magazine. The most resistance of some exceedingly clever photographic designs. We quote a few interesting conclusions:

In one day a healthy man will eat, on an average, one and a half pounds of bread in the form of the white or brown loaf, biscuits, pastry, scones and the like, all of which, of course, have for their essential element baked flour. For the first ten years of life and the last ten we will assume that only this quantity is eaten. So, altogether, our typical man consumes, on an average, one and one-half pounds of bread each day for 60 years. This works out at between 14 and 15 tons of bread in a lifetime!

approximately 53% tons.

The liquid refreshment of the inner man will provide some statistics of a amounts to 42% tons.

It is now about five years since Lord Rowton, who was once Lord Beaconston House, a great hotel for the London homeless, in which a man can Handsomely equipped and generously

is proud that he has a home in the We quote the London, rather than the New York, experience, for the reason that the Rowton Houses have had got into the pantry and ate almost all time to establish a record. Results show that the roughest men grew tame in decorous surroundings; and that the most hopeless gain courage from an environment of comfort.

Naturally the Rowton Houses have elevated the neighborhoods in which
