The purchase of a Piano or Victrola is only purchased invariably once in a lifetime. Therefore it behoves the purchaser to get the best and make sure you have the best.

I have had 25 years experience in tuning and repairing musical instruments, therefore feel quite confident I can choose the best instruments on the market.

I shall be pleased to place any instrument in your home beside any other in fair competition and let you yourself be the judge, without you feeling under any obligations absolutely. I can also save the purchaser quite a few dollars on account of my expenses being so low. I will always give you my best personal service and devote the whole of my time to supplying the country people. A postcard or telephone call will ablice.

Yours truly,

F. WATERS

PLANTS FROM CUTTINGS

Plant Propagation as Described by a Master Hand.

Be Your Own Developer of Geraniums—Light Fall Pruning of Orchards is Safe—The Barberry Hedge a Spreader of Bust In Grains.

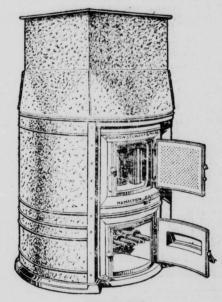

(Contributed by Ontario Department of Agriculture, Toronte.)

Toward the end of the summer, the amateur flower grower often wonders how the stock of geraniums in the flower border can be increased and preserved by some other means than by taking up the old plants in the autumn; the last named method not having, perhaps, proved successful in past seasons. By starting fairly early, toward the end of August, before cold chilly nights appear, a nice supply of young plants, more especially of all kinds of geraniums of the flowering kind, or those having fragrant leaves, or even the bronse or silver leaved kinds, can be had by starting cuttings or slips of these plants. First of all obtain a shallow box about three inches deep, ten or twelve inches wide, and from twelve to twenty-four inches in length; an empty haddie (fish) box will do very well. It should have some small holes bored through the bottom for drainage. Pack this box firmly with moist, clean, gritty sand; sand that will make good stone mortar will do. Then take the terminal or top part of the young growth of plants about four or five inches in length, each shoot or cutting having from four to six joints where leaves are produced. Make the base of the cutting just below one of these nodes or leaf joints, making a clean cut with a sharp knife flat across. Cut off some of the lower leaves, leaving two or three leaves at the top. Cut off all bloom buds and blossoms where possible. Make a hole or drill in the wet sand deep enough to set fully the length of stem of cuttings in the sand. Water them well once, and keep the sand moist until cuttings are rooted, which should be in five or six weeks' time. The box can be set out of doors in partial shade until the first week in September when they can be taken into the window. When cuttings have roots about an inch in length dig them carefully from the sand without in juring the roots and pot them singly into small 2½ inch pots or set them about two inches apart in well drained shallow boxes in a soil made up of one part sand, one part leaf mould, and about six parts of ligh

Seasons Greetings and best wishes to all for a Prosperous New Year.
