

shown to be perfectly groundless, but even if it were not so, it could hardly be urged on the ground of morality that a woman should go on suffering because she ought not to suffer any diminution of that animal propensity which it is the chief object of the higher life of all religious culture to subject, and the subjection of which forms for all creatures the greatest difficulty in existence.

There are cases of myoma demanding surgical treatment upon which removal of the uterine appendages seems to exercise no satisfactory influence. Mr. Knowsley Thornton has made a very valuable suggestion—one which certainly deserves very careful consideration—that all cases of myoma requiring interference are first to be subjected to the removal of the uterine appendages, and then to subsequent operation if it should be necessary. The only objection to this I can offer at present is an incomplete one. I have pretty well satisfied myself that there is one form of myoma on which removal of the appendages exercises no control. This variety I have named the soft oedematous myoma. But it is not easy to recognize this form of tumor until after it has been removed. Again, there are a few cases, very few I have found them to be, in which the appendages cannot be removed, and we must proceed to hysterectomy. Finally, the removal of uterine tumors has had such brilliant results in Bantock's hands that I am in hopes that a new era for hysterectomy is being opened out.

Another class of cases wandering about after relief are those upon whom I have operated in large numbers, and have found chronic and incurable disease of the appendages in the form of chronic inflammation of the ovary, chronic inflammation and occlusion of the tubes, these latter being occluded and distended by serum, pus or blood. When I first published my work on this subject there was, of course, a large amount of incredulity expressed about it, and this incredulity was not much lessened by the exhibition of a large number of specimens at various societies, and their permanent exhibition in the museums of the colleges of surgeons. Many, particularly amongst my metropolitan brethren, loudly asserted that there were no such diseases,
