 σ CETI(1900, $\alpha = 2^{\text{h}} 14^{\text{m}} 3\text{s}$, $\delta = -3^{\circ} 26'$, mag. var., type Md)

Four spectra of this well known variable star have been made since the extended series at the December 1906 maximum. Apart from the emission band at H_{β} , which was present at the 1906 maximum and is not seen at the time of these observations, the other emission and absorption bands seem to be similar to those of the earlier date. The measures of the sharp H_{γ} and H_{δ} emission are fairly reliable, those for the absorption lines only approximate. H_{β} emission seems to appear only at the brighter maxima.
