

# The Dairy Barn

---

**T**HE COW STABLE is the kitchen where the food for many city babies is prepared, and it is the duty of every farmer and dairyman to see that the kitchen is clean. Cow stables should be light and well ventilated, fitted with concrete floors and steel stalls which are practically indestructible and are necessary for the following reasons:

"Concrete floors do not soak up manure, which is one of the chief causes of the spread of tuberculosis in cattle.

"Steel stanchions and stalls do not obstruct the light, are easily kept clean and do not soak up manure. Stables constructed in this manner are lighter, cleaner and more comfortable for the cattle."

P. B. TUSTIN, Associate Royal Sanitary Institute,  
Chief of Food and Dairy Division,  
Health Dept., Winnipeg, Man.
