

teries are not good.

Dr. Galloway.—How would Bier's congestion treatment be adapted to that, Dr. Lehmann?

Dr. Lehmann.—There would be disadvantages to that on account of the marked arterial sclerosis. I don't think a very good hyperaemia could be produced on account of the sclerosis.

Dr. Sharpe.—Would you leave this toe alone and watch it for results? As hyperaemic treatment has been suggested, would it be advisable to try the hot air treatment?

Dr. McKenty.—I think Dr. Sharpe's suggestion to leave it alone is the right one, if it is progressing all right.

Dr. MacKay.—As the diabetic sclerosis is increasing each day I would suggest that the operation be performed now rather than any delay.

Dr. Sharpe.—He has been under medical treatment for three weeks.

Dr. McKenty.—I would suggest continuing that treatment for two months, and perhaps the condition will disappear.
