balanced foods, and it mature sow in summer needs nothic else unless suc-kling pigs. Then shehould be fed lib-lerally on middlings, arley, tye, corn, bran or oats ground id in a slop, three times as much bran sother foods being given when they are ixed.

balanced foods, and a mature sow in summer needs nothit else unless suckling pigs. Then shelould be fed liberally on middlings, arley, tye, corn, bran or oats ground id in a slop, three times as much bran sother foods being given when they are ixed.

The progeny of york sowsare always smaller and less in umbers than the yoang of mature imals, and they rarely make as mucland as profitable pork per head.

Cultivation Turnips.

In order to bring Taips to a state of perfection, Mechan Monthly says the temperature must e comparatively low. No one can ise good turnips when the temperaturis over 55 or 60 degrees, and as soon; it gets beyond this they are hot anottringy. Thus in Pennsylvania the turp would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be sown to get the be results about the middle of September A hundred miles north it would have to be two weeks carlier and so on, ul in Canada one might sow turnips out midsummer and yet have fairlyood results. In some parts of our scheme produce all yellow gillow drones Ny 1 am fast coming to a conclusion the temperature it request, it is a hint for successful culture anwhere. It may be further remarked the bave good mild turnips the soil cann possibly be made too rich.

Farms Heveda.

The state of Nevia has 1,200 farms

The state of Neyla has 1,200 farms which have lately be reclaimed from the arid desert by ligation. It is believed that when me money has been used to irrigate its less and make them productive, Nevada opulation will assume respectable prortions. COMB HONEY PRODUCTION.

Statements Made at the North American

Langstroth is almistake. A super with section holders, consisting of two sides and a bottom bar with separators, a follower and a wedge, was his preference.

Sections should be 44 inches square. The thickness is a disputed question. In Canada nearly all the beckeepers was esctions 14 inches thick. In the United States the thicker sections are used—seven to the foot—or 14 inches. He believed the tendency was toward thinner sections. Regarding bees; their comb building characteristics and honey gathering qualities must be looked after, instead of their individual beauty. He took issue with the statement that colonies could be too strong early in the season. If a colonic became crowded too early to put on sections, he would put on an extracting unper until the time arrived for putting an sections. The sections should be filled with full sheets of light foundation.

Lime wash helps to lighten as purify poultry quarters, and light too plentiful in winter time.

FARM CONVENIENCES.

Which Contribute Largely to the Comfort and Welfare of the Owner.

Beekeeper's Convention,
In a paper having for its subject the production of comb honey, R. F. Holterman said before the convention of North American Beekeepers at Chicago many things of general interest. He advised as regards locality a place where the honey flow is heavy rather than prolonged. In the face of great diversity of opinion, he hazarded the belief that any material variation from the depth of the Langstroth is a mistake. A super with section holders, consisting of two sides and a bottom bar with separators, a following the contribute to many farms as regards the observed on many farm

rived for putting an sections. The sections should be filled with full sheets of light foundation.

Mr. Holterman spid that no one who wishes to raise comb knoney to perfection will ever care to prevent swarming entirely. Swarms should be hived on the old stands upon very narrow strips (starters) of foundation or else upon full sheets of fearwards and the build as shed over the pile that will propose the pile that will propose the sufficiently to prevent its fertility.
