LEVEQUE, ARCHITECT, No. 12 PLACE D'ARMES, MONTREAL. the party of the second section of the second

A Company of the State of the S

WEEKLY, TEST.

THE USE OF TOOLS.

The Western Farmer says: "One of the first thingsto be taught a boy upon a farm is the use of tools. He should be a good carpenter and blacksmith-in fact, able to make or mend most any implement upon the farm. A few tools are always necessary, and the proper use of them can soon be acquired, to that the farmer can shoe his own horses, make his sheds, build his barns, and thus turn every day to

WEIGHING STOCK.

Let every farmer where it is practicable, periodically weigh his stock this winter sheep and pigs especially, and let him rest assured, when he finds their weights at each successive weighing stationary or nearly so that he is losing money and wasting his feed. No animals pay that barely exist. The horse loses power and endurance, the cow shrinks her milk, the light clip of wood and the scanty number of puny lambs in the spring tell the fale of sheep, and the poor pig, and the most neglected of all, too often becomes a bag of bones. TURNIPY BEEF.

A correspondent of the New England Farmer writes:— Several years ago, I had quite a lot of rutabaga turnips, and having a two-year-old heifer health, and is by no means a rare cause of serious the experiments of fatting her types. the experiments of fatting her upon them. I tied a serious liability to abortion, caused by an undue her in the barn and gave her what she could eat of presure of the food upon the parts. Moreover, on with a very little hay and no water, as she would the score of self-interest as well as of humanity. drink none after a short time. The result was, she grew well and fatter nicely, convincing me that there was much nutriment in the turnips. But, to my sorrow, come to eat the beef, although well fatted, juicy and very tender, it would, in spite of all we could do to the contrary, taste very strongly of the turnips. So much in favor of your correspondeut's belief in the value of turnips."

TEST SEED BEFORE SOWING. Mr. Bowick, the English author, urges that where there is the slightest reason for doubting the germinating powers of seed grain it should be tested before sowing much more generally than is often done. His directions, though too late for our fall crops and much in advance of spring seeding, may well be put on record for future use. They are as follows:—" Draw 100 grains promiscuously, lay them in two pieces of thick flannel, well saturated with rain-water, place it in a warm temperature, keep it wet, and in fifty or sixty hours you will fied it sprouted. The general adoption of such a handy method would give a certainty to what a farmer was actually sowing. Thus, if he found the germinative percentage low, he must add more seed to make up for the deficiency."

COAL ASHES.

I consider coal ashes one, if not the best fertilizers we have. Have got all I could gather for several years, but now some others speak well of them. A professor in Miami University made his walks in his garden with the ashes from the college; he found that when he dropped turnip or other seeds, they grew finer than any other. I had a pile of anthracite ashes three feet high in my garden hauled there in May, 1875; there was ice on the bottom of the heap. I thought it would save ice better than tan. On top of the heap, there grew a number of pumkins which had been thrown in when rotten in the village. I thinned them to three vines, and they were the finest and largest I had that year; they were three feet from the ground that is the crown. The vines covered more than, 150 square feet.—J. McHunnon, in Fruit Cultivater.

CULTIVATING ORCHARDS. An Ohio farmer says: "I have an old orchard on my farm that is probably fifty years old, which had hardly any cultivation for the last twenty years when I moved on the farm five years ago. The orchard was then rapidly on the decline. I concluded three years ago, to cultivate the old orchard and plant young trees in the vacant places where trees formerly stood. I have followed cultivation for three years in succession. I notice it) ada salutary effect on the old tress, by beginning to look more thrifty than before the cultivation took place. I would not plow very deep near the trees but shallow, so as not to cut up the roots to such an extent as to gather several waggon loads of roots causing every tree to die in ten years. Cultivating PURY & McINTOSH, an orchard in less time than ten years. It is but a natural consequence; when the roots of a tree are cut off the tree is bound to die. I prefer shallow plowing so as not cut the roots. I have also experienced where orchards are not cultivated that the roots are more liable to form near the surface of the ground than those where cultivation is repeated every three or four years. There is also another drawback to cultivated and uncultivated orchards -the absence of manure. There are too many farmers who think that manure is too precious ar article to apply to an orchard, hence we see many orchards through the country that are on the de-cline. I prefer cultivating and manuring orchards as well as any other ground. This is my practical experience. Others may carry out their peculiar views if they desire. As a general thing, I would prefer to plant orchards the first year either in corn or potatoes, or such crops that would require throughout the season cultivation and hocing; the second and third season I would sow either wheat or rye, and then seed down into grass.

SALT IN AGRICULTURE. Few persons realize the value of salt in agricultural operations. In large quantities it is, of course, au injury, destroying every-thing vegetable it comes into contact with. In heavy soil it is also an injury, as the tendency is to make it still heavier, and thus whatever good it might have in one respect is outweighed by the other. But in light, sandy soils, or those elevated tracts of land not wet, but which are liable to become dry in summer time, it has been found of the greatest berefit, and this chiefly on account of the property it has of absorbing moisture from the earth in dry weather. It is for perhaps as much as for any chemical quality that it proves so beneficial in these cases. Usually wheat does best on rather heavy though not wet lands; but where salt has been used on light soils, as good crops have been gathered as on the most favored heavy soils. In the far western States, where rain does not fall often, and the danger to crops is chiefly through drought in the summer time, salt in light doses ought to prove beneficial, and in the sandy soils of Delaware, Maryland and Virginia, it might be employed to a much greater extent than now with profit. It is is chiefly for the moisture it seems to draw from the atmosphere, that it has often been found of so much good for asparagus. The a paragus requires an immense deal of water in the make up of its stalks, though it does not like to grow in wet g ound; and this moisture the salt supplies. It us also been found of excellent benefit in raising turnips, beets, cabbage and other succulent vegetables But it must not be forgotton that it is an injury in soils already wet or heavy; and therefore good as it is in so many cases, as indiscriminate use of it will result in disadvantage. In this repect it is like lime and some other things, in which even 'salt will not save it." - Germanton Telegraph. TREATMENT OF MILCH COWS IN EARLY WINTER.

At no sesson of the year do milch cows need better and more generous diet than in early winter. The change from grass to dry fodder is of itself sufficient cause to produce more or less derangement of health. But when the animal's tone and vigor have been lowered by a long period of milking, and shejis; then subjected, at the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and a change of food from nutritous after the same time, to the rigors of winter and the same time, to the rigors of winter and the same time, to the rigors of winter and the same time, to the rigors of winter and the same time, to the rigors of winter and the same time, to the rigors of winter and the same time, to the rigors of winter and the rigors

त्राच्या व्यक्तिमञ्जूष्टि है, अन्यक्ति व्यक्ति व्यक्ति है,

herbage to dry, coarse and often innutritious fodder a severe tax is laid on her system. Yet, on many farms, it is the practice to feed to cattle, in early winter, only coarse and inferior todder and the poorest hay, because these articles have been stored last in the barn, or on the tops of the mows, and must therefore be disposed of before the better portions of the supply can be reached. This how, ever, is a great mistake, as the best food should be given when the cows first go into winter quarters. Afterwards, when they have been dried of their milk and have grown accustomed to the change of diet, the poorer food may be used; or better still, as animals, like men, are fond of variety in their diet, the coarser and lest nutritious fodder may be advantageously used in conjunction with that of a better quality. Through neglect of this precaution, however, it frequently happens that cows in milk lose flesh durine November and December, and sink into a bad condition to endure the still more severe weather yet to be expected. To this misfortune, in cases where poor or damaged fodder has been found necessary to be given out first, the feed should be suplemented with rations of ground grain, oat and corn-meal mixed, bran, or ship-stuff to add a prorer amountnutriment to a given bulk of fodder. Compelling cows to consume an excessive bulk of inferior food in order to enable them to support life and yield cows should not be allowed to lose flesh in early winter, for it would require much more food to restore them to the good condition in cold weather than in summer- Besides this, as lean animals are more susceptible of cold than those in flesh, and a proportionately larger amount of the food they consume is therefore expended in generating a sufficciency of animal heat, it would require considerable more food to carry a poor beast through winter than a fatone, even though nothing may be added to the animal's condition. The necessity of shelter for all kinds of stock from the storms, frosts, and inclemency of this bleak season, has been fiequently dwelt upon, and its economy as well as its humanity fully demonstrated -Rural New Yorker.

TO LET-Farm of 180 acres, at Longue Pointe, 3} miles from Montreal. Very suitable for milk selling. Possession first of May next. Apply on the premises to Mrs. E. QUINN, or to F. A. QUINN, 31 St. John the Baptist street, Montreal.
