

I had no difficulty. The first moult escaped me, the second occurred 25th Sept., the third 6th Oct., the fourth about 15th, and the first chrysalis formed 21st Oct. The butterfly emerged 8th November. The resemblance to genus *Phyciodes*, especially to *P. Tharos*, was close in all stages. I doubt if *Eresia* and *Phyciodes* are properly more than groups of one genus.

YOUNG LARVA.—Length .08 inch ; cylindrical, of even size, the segments well rounded ; color greenish-brown ; on dorsum four rows of pale-colored flattened tubercles, from each of which springs a long black hair, curved forward ; head larger than body, reddish-brown ; shape sub-ovate, bilobed.

After second moult.—Length .17 inch ; dorsum and upper part of side brown, the lower part and under side yellow-green ; furnished with seven rows of spines, one dorsal, three lateral, each spine stout, broad at base, tapering to a blunt point, and thickly set with short brown bristles ; the dorsal spines, and the tubercles from which they spring, greenish ; those of first lateral row black ; the two lower rows greenish ; over the feet is a row of minute spines with bristles, all greenish ; head sub-cordate, the vertices rounded ; color dark brown, shining.

After third moult.—Length .26 inch, same shape ; color dark brown, specked with blue-white ; the lower part of side greenish-white, finely marked with brown ; on the lower side of second lateral spines is a longitudinal black stripe, only found on the middle of each segment ; all the spines dark brown except the lower laterals and the minute ones over feet, which, as well as their bristles, are greenish-white ; head as before, bronze-brown.

After fourth and last moult.—Length .6 inch.

MATURE LARVA.—Length .7 inch.

Color yellow-brown, the dorsum and upper part of side much specked with dull white ; running with first laterals is a whitish line, and just below a black stripe, broken at the joints of the segments ; along the base of body, embracing the spiracles on its upper edge, is a broad dull white band, mottled with greenish and brown ; the lower lateral spines on this band, and the spines over feet, greenish-white ; all others brown ; head sub-cordate ; the vertices rounded, smooth, brown.

CHRYsalis.—Length .5 inch ; cylindrical, the abdomen stoutest ; head-case short, bevelled at the sides, nearly square at top, the vertices pyramidal, not prominent ; mesonotum slightly raised, rounded, followed by
