

tion, M. Erichsen passed a full-sized male median lithotomy-staff, and opened the urethra at the vaginal aspect, dividing the under surface for about one inch. A pair of small lithotomy-forceps were then passed into the bladder, and the foreign body was removed. On examination, it was found to be a No. 4 male gum-elastic bougie, coiled up, and coated with phosphates to the thickness of about one-sixteenth of an inch. The ivory head was not covered with any deposit, and had doubtless been the cause of the distinct click heard on sounding. The wound in the urethra was brought together with silver sutures, and a catheter tied in. The patient was then removed to bed, and an India rubber tube attached to the catheter to carry off the urine.

The patient went on well till December 25th, when some hæmorrhage occurred from the vagina, which ceased after a slight loss of blood. This was repeated on the 26th and 27th, until the patient was much weakened by loss of blood. It was then found, on further examination, that she was in the fourth month of pregnancy, and that abortion was threatening. She was transferred to the care of Dr. Grailey Hewitt, under whose treatment the progress of miscarriage was stayed; and she gradually recovered, leaving the hospital in about a month after the operation.

Mr. Erichsen stated that this case was extremely interesting in a medico-legal as well as in a surgical point of view. Here was an unmarried girl pregnant, with impending abortion, in whose bladder a male gum-elastic bougie was found. There could be no doubt in the minds of any conversant with the practices that were unfortunately notoriously rife in this country—though less so than in some others—that the bougie had been employed for the purpose of procuring abortion; that it had been used by an unskilled hand; that the urethral orifice had been mistaken for the os uteri; and that the instrument, having slipped in, had occasioned the symptoms of calculus for which she had been admitted. His suspicions as to the alleged calculus being, or having for a nucleus, a foreign body, had been aroused by the reticence of the girl, but he had thought, as is very common in such cases, that the foreign body, whatever it might be, had been introduced to gratify sensual feelings, rather than with a positively criminal intent. Stone in the bladder was so rare in young women, that, when a calculous mass was found, it was almost invariably found around some extraneous body, such as a hair-pin, a piece of pencil, etc., that had been accidentally slipped into the urethra. In this case, the mode of introduction was different; and there could be no doubt, from the
