Late Chicks. Chicks are hatched until well into the sun r hatching purposes cost one-half less than amend it. The protein needed for the use for hatching purposes cost one-half less than in the winter season, while more chicks are secured, and they are also more easily raised if kept clear of lice. In the summer, where the pasture is well supplied with young grass, seeds and insects the chicks will need but the stock kept on the farm may be obtained in one of three ways: It may be purchased in the form of concentrated feeds, such as wheat bran, oil meals, etc.; it may be obtained by growing the legumes which are able to obtain declared in a state of siege. Colby mine in Michigan with reason discrete feets are the state of siege. when a nen is anowed to natch and raise a brood of chicks late in summer, she will prove a better layer in winter than if she is deprived of that privilege. Prices are seldom below 20 cents per pound for the late chicks, and they

ting in May will bring off their broods in June, when the weather is warm and the conditions favorable, provided the chicks are not constrained by the constraint of George N. Hall. stoyed by lice, which should not happen on crops richer in protein. Anent the amount of water in butter a rack in a cool place—the cooler the better— and turning them over three times a week.

f you wish to preserve eggs, in order to re-ain them until prices are higher, keep them the same manner, but first rem

THE DAIRY.

The Best Churning Point.

At the West Virginia experiment station, about two years or so since, sweet cream was churned at different temperatures from about 65°, as we remember down to 42°, with varying results, the best being somewhere in 50's. Not long afterward we were startled by the announcement from the Texas station that cream in that latitude required to be churned at 75°, the inference being drawn that the warmer the climate, the higher the churning point. And we think it was from the same station that we were told that when cotton-seed meal is fed, the best churning point is 8 or 10 degrees higher—even to 85 degrees in seed meal is fed, the best churning point is 8 or 10 degrees higher—even to 85 degrees in that latitude. Now, only difference in conditions can account for these wide variations; and the natural inference is that evey dairy—an must observe and study the conditions, and by experiment find out for himself what temperatures are best suited to his herd and to the various operations in his dairy. Let him get all the light he can from outside sources, but rely on his own observation, experience and judgment for all his practices. To do this, he must have a reliable thermometer. Not guesswork will do. And let us here suggest that something like a steady, even temperature throughout all the operations will be found best. The dairy room ought to be somewhere near the point for keeping and churning the cream, which should be put into

perature at which it is churned. Afterward, luced, to await the market. But we do not believe that low temperatures turn out as good keeping butter, nor as fine flavored, as medium temperatures; and the lower the temperatures maintained in manufacture, the lower must failed to cure. We are ropes it we of it will back our belief and send you may be supported by the maintained in the manufacture of the ON TRIAL FOR 90 DAYS. TELLS YOU HOW TO

Minorea is about a pound larger than the Leghorn and lays larger eggs, the comb of the Minorea also being larger. The popularity of the Leghorn is partly due to the yellow legs and skin.

Apparagus Beds and Chieks.

Put your hens in small coops and place the coops between the rows of asparagus, so the chicks can have liberty, and they will do more to destroy the asparagus beetle than can be accomplished in any other way. By using small coops, so as to confine the hens, any number of broods may be put near the asparagus, and the more broods the greater will be the destruction of insect pests.

Excelsior.

New York. We do not know the price but judge it cought to cost about 25 cents. It is illustrated and gives the methods of preparing all the principal remedies for both insects and fungl, with the names of the fruits to white the several ingredients are applicable; also a description of the several machines introduced and how to use them. The interest at stake ought to prompt everyone to immediate preparation for the fight against common enems.

Excelsior.

Never rest quietly in the idea that there is no further chance for improvement, and the present age is one of the greatest the body. Anaxagoras, a learned Greek who lived long ago, was laughed at by his fellows between the suit the sum was as large as Pelopenesus. How astonished they would have been (says a writer) if they could have been (says as writer) if th army contractors tried to induce the inventor to sell his secret for an enormous sum, which
