Since 1857, *Gray's Anatomy* has unquestionably been the standard text-book on its subject among all English-speaking peoples. The demand for thirteen editions has been utilized by subjecting the work to the searching revision of the foremost anatomists of a generation. In no other way is accuracy and completeness to be attained in treating of so complex and detailed a science. The series of illustrations is quite as famous as the text. Their large size not only enables the various parts to be brought into view, but also allows their names to be engraved directly upon them. Thus not only the name, but the extent of a part is indicated at a glance, a matter of obvious importance and convenience. Many new illustrations appear in this edition, and the whole series has been re-engraved wherever clearness could be promoted. The liberal use of colors lends added prominence to the attachments of muscles, to veins, arteries and nerves. The work is also published with illustrations in black alone.

As heretofore, the revision has been most thoroughly performed, so that the work is kept always abreast with the advances of its science. Especial attention has been paid to the application of anatomy to surgery, and the work is therefore indispensable to all who find in the exigencies of practice the need of recalling the details of the dissecting room.
