Table C, that the moon's age was 8, corresponding to which, in the second column of Table D, is 5h. 39m.; this, subtracted from the time of high water, 4h., efter increasing it by 12h. 24m.. (because the sum to be subtracted is the greatest,) gives 10h. 45m., for the time of high water on the full and change days.

In all the preceding calculations of the time of high water, we have neglected the correction avising from the variation of the distances of the sun and moon from the earth, and from the different declinations of those objects. These causes might produce a correction of 10m. or 12m. in the time of high water, and sometimes more; but in general the correction will be much less, and may therefore be neglected
