Hill Selection of Potatoes (5' 12

There is a widespread practice mong farmers of planting second-ite potatoes, regardless of whether are come from vigorous hills or not. his is a serious mistake which can mly have one result(i.e., the early unning out of the variety. The prac-

It pays. ried out, for although it involves some extra labor it is worth it many times. If the seed has been planted one seed piece in a place, uniformity of Maple and other seeds ripening now

HARD AND GARDEN

Maple and other secus tipening now seed piece in a place, uniformity of cultivate cabbage in the middle of selection can be secured by confining he day when the leaves are limp, the choice to the one stalk hills in accorption in a place, unitormity or selection can be secured by confining the choice to the one stalk hills in the field. This method can be var-ticd, however, by setting a standard in the ratio of not less than four good marketable potatoes to a one-stalk hill, seven to a two-stalk hill, and ten bill, action to a two-stalk hill, and ten troe stalk hill. When the crop is an intre-stalk hill. When the crop is not not to studie the start of the growth or two thirds ripened the growth or two thirds repeated and marks a number of hills showing exceptional vigor for of hills showing exceptional vigor for of hills show and exceptional vigor for a bridging these mark-ted hills can be dug by hand. All of the marked plants have shown vigor, but all may no produce destrable but all may not produce desirable tubers. Any marked bill which pro-duces fewer tubers than we have set for the standard, or is undesirable in other respects, should be discarded. Selection in this manner secures vig-or, which is of prime inpostance in enabling the crop to withstand insects and diseases. Moreover, the grower is obtaining all of the seed stock from hills that have produced a fair num-ber of marketable tubers-thus in-suring an increased vield.—F. C. N. but all may not produce desirable tubers. Any marked hill which pro-

With the Chicks

Potato Growing Experience Peter Brodie, Queens Co., P.E.I.

By Mrs. G. W. Randlett. Prepared chick feed is properly bal In itrating for potato buy we should also treat for blight. For this province laberts and the first of Sep-genber the proper time. Scientists will us that potatoes rot before and cose down through the rootlets into the potato. Spraying about the didde of September would be geta benefit, as that is about the first benefits as the status of the source and the millik or water enough to make the mixture ernubly, is good. In treating for potato bug we should like treat for blight. For this province think August and the first of Sep-ember the proper time. Scientists middle of September wordd be a reat benefit, as best is about the me the rot generally strikes in this long enough. Sprinkle a little sand worne: What little spraying I have I have found that (the tops kept Never feed raw oorn most stread)

province. What little spraying I have since it is a spray of the spray before feed may listle same ment have found that the tops kept listle same ment have found that the tops kept listle same ment have found that the tops kept listle same ment have found that the tops kept will handfilime Provinces farmers will here to subject it would be to their No. I apples the d, as a cre. And if we had free entry have for sale, there would be no trow will a mill of dollars to the farmers of the Edward I shad alone. If our warm and clean, and there may all around, by keeping our five weeks, and be read for the mark attime for words by keeping our five weeks, and be road for the mark attime for our grain and the growth of chicks, are on bury were weed have a tendency for better and far state. If our yarm for the shift of themselves as soon as they are well started.

When the chicks are busy and scratching it is sign they are happy

scratching it is sign new are nappy and thriving. Chicks neglected while growing do not make good breeding stock. Give them plenty of feed, good care, and clean houses and yards at all times. Do not put chickens hatched at dif-

ferent times together. The older ones will crowd out the younger.

The harvesting of the corn crop at less expense.

Storing the corn crop in less room.

Harvesting the crop in any weather.

Perfect and complete preservation of the crop.

Furnishing a perfect and uniform feed, maintaining the stock in better health.

An increase of at least 20% in the flow of milk and a decrease in cost of feeding of from 15 to 20%.

Sale of hay without robbing the land.

This is about your last chance of getting a silo this year. If you want to feed silage next winter you must act quickly.

There is probably a De Laval agent in your town who will be glad to quote you prices, terms, etc. If not, an inquiry sent to the nearest De Laval office will receive prompt attention.
