

MCGILL UNIVERSITY  
MONTREAL

SUPERINTENDENT ENGINEER'S  
DEPARTMENT

December 29, 1931.

Sir Arthur Currie,  
Principal & Vice-Chancellor,  
McGill University.

Dear Sir:-

We are now prepared to recommend the Humidrad as the most economical method of overcoming the lack of humidity in your house during the heating season.

We attach circular giving description.

It's installation will have to take place on a mild day, as the whole or a section of your heating system will have to be shut down.

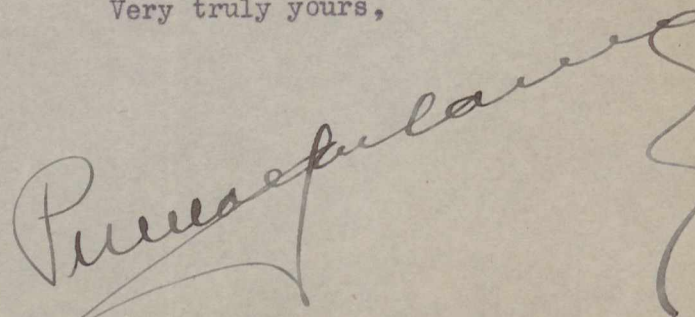

Cost depends upon the size of the house and access to running water and drainage.

The large size evaporates twenty to twenty-two gallons of water daily with building water at one hundred and forty degrees (140°).

Definite estimates for installation will be furnished on request.

Very truly yours,

P. W. MacFarlane:-  
EA/

Superintendent,  
Buildings & Grounds.

ENCL.
