

The above indicates that tobacco waste is too valuable at the present time as a source of potash, or as fertilizing material to be shipped out of the country. The United States has placed tobacco scrap under an embargo for this reason.

#### RETURNS FROM ONE TON OF STEMS.

If we count on an average of 1 per cent nicotine at \$2.25 per pound wholesale, the return would be \$45 per ton, or over twice the cost of raw material and chemicals used in the hydrocarbon process. A conservative estimate of 75 per cent extracted would yield \$33.75 or \$13 more than the cost of material.

With potassium carbonate at the present (April, 1918) price of 85 cents per pound of 90-95 per cent pure, and with a yield of 200 pounds from one ton of stems, extracting both the nicotine and potash would be a very paying proposition. No better opportunity could be chosen for starting. Good returns are assured and will not depend upon the abnormal demands of war.
