

from the peritoneum in 22. The disease may appear as tuberculosis periophoritis, disseminated or diffused, and as miliary tubercle of the substance of the ovary (20 out of 48 cases), cheesy tubercle or tuberculous abscess. The two latter are about equally common. The former, much more frequent, may pass undetected by the naked eye, but the disease shows its features very characteristically under the microscope. In the 48 cases, tubercle bacilli were detected 9 times by the microscope and 4 times by experiments on animals. Orthmann describes 4 new cases under his own care. In one there was distinct tuberculosis of the yellow substance in a corpus luteum.—*Brit. Med. Jour.*

SANMETTO IN CYSTITIS, PROSTATITIS AND GONORRHOEA, AND IN ALL IRRITABILITY AND INFLAMMATION OF THE GENITO-URINARY TRACT.—In my practice the administration

of sanmetto has given excellent results. I have found it unequalled in cases of cystitis and prostatitis, and all cases of irritability and inflammation of the genito-urinary tract. In many cases of gonorrhœa I have used it with excellent satisfaction. I am pleased to recommend sanmetto to the profession as a preparation which has proven invaluable to me in treating the above-named conditions.

SYPHILIS INSONTUM.—Lesser (*Berl. klin. Woch.*), divides unmerited syphilis into (1) congenital syphilis, (2) syphilis contracted in legitimate sexual intercourse; and (3) syphilis contracted by direct or indirect contact with the syphilis virus exclusive of sexual intercourse. It is the last-named group which Lesser chiefly describes here. Of course every extragenital chancre must not be placed in this group. The author maintains
