

COCKSHUTT DISC HARROWS

No. 4
In Throw

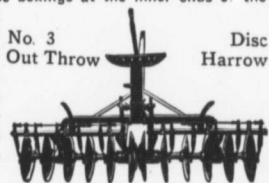

Disc
Harrow

The No. 4 Cockshutt In Throw Disc Harrow combines simplicity and ease of operation. Forty hard STEEL balls (not iron) run in hard chilled steel bearings and receive the end thrust of the sections. This gives a much longer life to the machine. All bearings are oiled by tubes from the scraper holders, instead of by cups, and no dust or grit can possibly enter the bearings. It is the lightest draft harrow on the market and at the same time will work in any soil with equal freedom. The frame is substantially built and the arch is of the finest channel steel specially braced. "Cockshutt" discs are of special shape which thoroughly stir and pulverize the soil.

Draw Light---Work Right

The "Cockshutt" No. 3 Out-throw Disc has the same special features of the In Throw, being a model of strength, simplicity and efficiency. Note the easily adjusted spring pressure which is applied to the boxings at the inner ends of the sections. This keeps the discs cutting level always. The boxings are long wearing, hard maple, and are kept well supplied with oil by tubes leading from the scraper holders. All Cockshutt harrows can when ordered be fitted with tongue truck. With this attachment the driver is enabled to get the most effective work out of his machine with least exertion on the part of the horses.
