

II. ACCESS LEVELS FOR 1990

- A. The combined annual access for imports of broiler hatching eggs and chicks for calendar year 1990 shall be 21.1 percent of the 1990 Canadian production of broiler hatching eggs. The 1990 domestic production of broiler hatching eggs is estimated at 459,860,000.
- B. The combined access levels for broiler hatching eggs and egg-equivalent chicks in 1990 shall be 97,030,046.
- C. Taking into account the limited number of months remaining in calendar year 1990, considering especially chick production planning, both Parties have agreed to adjust the access level for egg-equivalent chicks during calendar year 1990 only. Therefore, the adjusted access level for egg-equivalent chicks for calendar year 1990 only shall be 14,385,000, which represents approximately 3.1 percent of domestic production.
- D. The adjustment access level during calendar year 1990 only for broiler hatching eggs shall be 82,645,046, which represents approximately 18.0 percent of domestic production.
- E. With respect to paragraphs II (C) and (D) above, both Parties agree to monitor closely and share with each other data on the level of trade in chicks during the balance of the 1990 calendar year. If the Government of the United States determines that trade in egg-equivalent chicks is falling short of anticipated levels in 1990, and so notifies the Government of Canada before October 26, then the Parties shall consult and use best efforts to reach agreement before November 9 on measures to ensure that the effective 1990 annual access for broiler hatching eggs and chicks reaches 21.1 percent of the 1990 Canadian production of broiler hatching eggs. If no such agreement can be reached before November 9, then, notwithstanding the provision in the last sentence of paragraph I (C), any proportion of unused 1990 chick import allocations may be converted into 1990 broiler hatching egg import allocations at a conversion rate such that 1 chick equals 1.27 broiler hatching eggs.
