Questions and Answers. Miscellaneous

Toad Flax.

You will find enclosed a plant which I found on my farm. Will you kindly tell me what it is and how to treat it? It seems to be a bad weed. Is there any law to make people look after such weeds in Canada, Parry Sound District, and if so, what steps should I take?

J. O. S.

Ans.—The weed is toad flax, or butter and eggs, quite common in Ontario. It is rather hard to kill, but clean cultivation will get rid of it. It gives little trouble where a short rotation of crops is followed. You had better see your township clerk re the destruction of noxious weeds. These laws are largely under municipal control. This weed is not generally considered a noxious weed, and possibly would not be severely dealt with.

Building Ice House—Storing Ice.

1. I would like to build an ice-house at the east side of my barn, to hold ten or twelve tons of ice. How much material will it require?

2. Also, explain how to store ice.

J. A.

Ans.—1 and 2. Ice houses may be built either expensively or in a very cheap manner. One, however, which will answer the purpose very well, and will be within most anyone's means, may be constructed in the following manner: It should be 10 feet square at the base and 11 feet high to the plate. The sills consist of double 2 x 4's, on which are erected 2 x 4 studs, 24-inch centers. They are capped with a double plate of two 2 x 4's on which rest 2 x 6 joist, 24-inch centers. The studs are boarded up outside with novelty or drop siding. There is no inside boarding, the sawdust being allowed to fill the space between the studs. The roof is composed of 2 x 4 rafters, 16-inch centers, boarded and covered with shingles. The material would comprise about 250 feet of rough lumber, 650 feet of drop siding, 700 feet of 2 x 4's, 85 feet of 2 x 6's; 24 squares of shingles, and about 50 pounds of nails. This building will hold in the vicinity of 20 tons of ice. On a farm of any size, it is not advisable to have too small a quantity of ice where one has gone to the trouble of erecting a place for the same. However, if you wish one of smaller dimensions, you could figure out the amount of material from the information given. This house is very much improved upon by an additional room for storing milk products and household goods. It is simply extended six feet, and, preferably, a cement floor put in the adjoining part. This list of material will not apply of course if you use the barn for an end or side.

Following are nine suggestions taken from R. R. Graham's bulletin on "Ice Cold Storage on the Farm":

1. Take the ice from a clean, pure and deep lake, pond or stream. Do not by any means store snow or poor ice.

2. The ice should be at least one foot thick.

3. Store the ice preferably on very cold days. It will handle more satisfactorily and keep better.

4. Put plenty of dry sawdust on the bottom of the ice-house, at least one foot, before beginning to store the ice.

5. Pile the ice cakes as closely as possible in rows and layers, breaking the joints, and fill the chinks with small pieces of ice or snow. The air space should be reduced as much as possible.

6. Do not fill the spaces among the cakes with sawdust. This practice is not advisable, and is therefore going out of date.

7. Leave at least one foot space between the ice and the wall of the ice-house, and pack it well with a good quality of dry sawdust as the ice is put in.

8. After all the ice is stored, put a foot or two at least of sawdust over the top. An extra amount will not be amiss to build the settling of the sawdust at the sides. Two or three feet of wild hay is a very good covering for the top of the ice if plenty of sawdust cannot be obtained, and wild hay or straw checked would do for the sides if about twice as much is used.

9. See to it that the ice is kept well covered throughout the summer, especially after any ice is removed.

Sydney Basic Slag

Was used by hundreds of Ontario farmers in 1913 and again in 1914 with as good results as fertilizers costing \$10 to \$20 per ton more money. We can give you their names. You may have been influenced by the propaganda of the German Government, which has spent huge sums of money in endeavoring to persuade the Canadian farmer that every fertilizer must contain a large percentage of potash if successful results are to be obtained. This is a fallacy, and much of the money that has been spent by the Canadian farmers on potash has been wasted. Our leading agricultural authorities tell us that our heavy clay soils already contain potash in abundance. Sydney Basic Slag supplies phosphoric acid, the element of fertility lacking to the greatest extent in cultivated soils, and in addition the lime and magnesia it contains liberate and render available for plant growth the crude potash in the soil. Sydney Basic Slag can be used for all crops, but it is specially adapted for application to old, wornout pastures and poor meadows. To get the best results it ought to be applied in the fall or early winter. Within the limits of a short advertisement we cannot tell you all about Basic Slag. Drop us a line, and our resident Ontario sales agent will give you a call.

GENERAL SALES AGENTS

We need a man in each county in Ontario capable of appointing agents to sell these goods. The right class of man, that is a man with a personal knowledge of the leading farmers in his county, will find this a profitable proposition for about six weeks' work twice a year.
