

ment adopted for the relief of her condition, she selected electricity. From May 10th to August 18th, 1888, she received thirty-one applications, chiefly of the positive pole, averaging from 70 to 100 ma. for five to ten minutes each application. During some of these sittings she suffered a good deal of pain, and I had often difficulty in encouraging her to continue the treatment. Towards the end of this course she became much improved in her general health. She seemed to gain color, and the blood condition was certainly much improved. She was stronger, evidenced by her being able to walk longer distances. She returned to her home, and spent August and September at an inland summer resort. In October she began to fall a little back in health, and the hemorrhages became again excessive, also some pelvic pain. She returned to me for treatment on October 11th, and remained until January 9th, 1889, receiving thirty-four applications of positive pole of strength 70 to 100 ma., as in first series. I was under the impression that she suffered more pain during this series, and I had greater difficulty in encouraging her. The monthly hemorrhages lessened and she again became stronger. During the six months of almost constant treatment the tumor never diminished nor changed its character permanently in any way. At times I would think it was smaller, but it would regain its size without any accountable reason.

She again returned home for a short time. In May, 1889, she visited me and received ten applications as before. In October she became discouraged, having received no lasting benefit from the electrical treatment, and asked me to remove the appendages. This was done on the 4th of October. I found some difficulty in reaching the appendages on account of the size of the tumor, but as there were no adhesions this did not matter. This patient returned home on the 9th November. She has, since the operation, passed two periods practically without discharge. Her pains have all disappeared, and she is as much improved in general health as could be expected in the time.

During the electrical treatment of this case I had been most
