

been noted by Prof. Crow and Mr. Caesar ; and Pine Finches appear to be quite common.

A Red-breasted Nuthatch and four Purple Finches were seen on Dec. 22, Juncos on Dec. 22 and in January, and a Robin on the College Campus on Jan. 4.

Ducks of at least two species have been seen on Dec. 30, early in January, and on Jan. 29.

A Late Migration of the Evening Grosbeak in Ontario.

TO see the Evening Grosbeak in winter, or in the sunshine of a March day, is not an unusual sight ; but to see it in May, with Warblers flitting and singing in its immediate vicinity, strikes the ornithologist as incongruous.

But this was the sight accorded to me on May 8th, 1911, in the second growth below the limestone bluffs at Colpoy's Bay, Ont.

There were seventeen of these handsome birds in the scattered flock—nine males and eight females.

They were feeding on the ground upon the fallen fruits of *Rhus typhina* (Sumac), and were much more wary of approach than in the winter. When disturbed, they flew into the trees, and remained so still that their presence would have been hard to detect but for their loud-whistled call-note, repeated at intervals.

On May 9th they were still in the same locality, but had disappeared by May 11th.

A Chipping Sparrow's Nest on the Ground.

On May 20, 1911, I found the nest of a Chipping Sparrow (*Spizella socialis*) on the ground among Red Clover, at the edge of an orchard, at Oakville, Ont.
