TUESDAY, AUGUST 28, 1906.

American waters, the Canadian cruiser should stop the practice.

Also it seems that some safe and sane policy should be adopted by the two countries that will prevent the incessant petty troubles over the fishing business.-Buffalo Courier.

We agree with the Courier that it is time an understanding was arrived at between the two countries regarding the fisheries, says the St. Thomas Journal in reply, but at the same time we cannot see wherein the Canadians have been great offenders. It is a well known fact that it is American disregard for the boundary line that makes it necessary for the Canadian Government to keep the Vigilant on the constant watch for poachers. Let the American Government punish offenders against the international agreement and there will be less occasion for complaint on the part of our American cousin.

### POOR DREDGE SPECULATION.

It is stated that the big suction, few months ago by the Government at second-hand, is not a success. This dredge was a failure at the mouth of the Mississippi, for which service she was built. The excuse was made that the channel in the Mississippi was too narrow for her. It seems that the Department of Marine and Fisheries paid \$150,000 for the Galveston without much inquiry. It took the chances of her usefulness with no guarantee that she would fit St. Lawrence channel. dredge, "Galveston," purchased a few months ago by the Government she would fit St. Lawrence channel. The sum of \$25,000 was voted last session to pay the expense of bringing the ship from Galveston and of repairing her at Sorel. She required more repairing than was expected, but was finally set to work below Quebec. Now the story goes that she has been condemned and withdrawn from commission and placed somewhere in cold storage. She must have cost by this time more than \$200,000

THE USE OF A DEFICIT.

Mr. Emmerson is still going about claiming that he is making or is about to make the Intercolonial pay its way. It is true that under an ordinary system of bookkeeping his deficit in the year ending last June would be between half a million and a million. It should be remembered that the Intercolonial was practically paying its way in 1896, though renewed rails were not then charged to capital. About \$700,000 is required to pay interest on the capital charges added in these ten years. required to pay interest on the capital charges added in these ten years.

But with capable and economical management more than this much surplus could be produced on the business that is down done. Other But with capable and economical Your management more than this much omei. railways which did not pay their way in 1896 are paying handsome divid

But if Mr. Emerson shall succeed in making the Intercolonial earn something, what will become of Sir Wilfrid's argument that government ownership is disastrous? Mr. Emerson's deficit was the Premier's opportunity. Sir Wilfrid declared in several campaign speeches that this deficit was sufficient to warn the country against any extension of the Intercolonial. Mr. Emerson's average deficit during the two years when the premier needed this argument to support this argument to support the Grand Trunk Pacific deal was more than twice as large as had ever been known before his time. Perhaps it was a deficit made to order.

The Yukon telegraph system, built by the government at a cost of three-quarters of a million, is now operated with a usual net deficit of \$120,000 to \$150,000 a year. About the time the system was completed the Canadian Pacific Telegraph Co. offered to take it over and operate the lines paying the government four per cent interest on its cost. This offer was rejected, the Minister of Public Works predicting that the line would earn more than \$30,000 net profit for the people of Canada. flated.

It was a very targe and expensive Reliance Loan & Savings Co miscalculation. But now comes the statement that a large part of the system will be abandoned, and the wireless method adopted for the Yukon business. Take it altogether this record is a fine illustration of the way not to do government busi-

## BOTH WELL INFORMED.

An Interchange of Compliments Be-tween Grant and Lee.

Toward the end of the war between the states the value of a well organized scout service came to be fully appreciated by the leaders of both armies. Perhaps no commanders of modern times were better served in this re-spect than General Grant and General Lee. Both were kept informed daily as to nearly everything that went on within the enemy's lines.

General Gordon relates that one morning toward the end of the long conflict, when the Confederates, officers and men alike, were reduced to un-pleasant straits for food, a captain from the Union headquarters went, under a flag of truce, with a communication to General Lee concerning the exchange

"General Lee," said the captain, with a smile, after delivering his message, "General Grant sends you his personal compliments and bids me assure you that he knows exactly what you had for breakfast this morning."

"General Grant must be misinformed as to this," replied General Lee, surveying the message bearer with a sad smile. "General Grant is a generous man, and if he had known with what a breakfast I had to content myself by would containly have sent me half "General Grant must be misinformed he would certainly have sent me half of his. But give him my compliments," he continued, with a sudden twinkle, "and say that although I do not know as to his breakfast I have full particulars concerning his dinner last night." -Youth's Companion

### DRY FARMING.

Explanation of the Principles of the

What western people have become accustomed to call the "Campbell system of dry farming" consists simply in the exercise of intelligence, care, pa-tience and tireless industry. It differs in detail from the good farming meth-ods practiced and taught at the various ods practiced and taught at the various agricultural experiment stations, but the underlying principles are the same. These principles are two in number: First, to keep the surface of the land under cultivation loose and finely pulverized. This forms a soil mulch that verized. This forms a soil mulch that permits the rains and melting snows to percolate readily through to the com-pacted soil beneath and that at the pacted soil beneath and that at the same time prevents the moisture stored in the ground from being brought to the surface by capillary attraction, to be absorbed by the hot, dry air. The second is to keep the subsoil finely pulverized and firmly compacted, increasing its water holding capacity and its capillary attraction and placing it in capillary attraction and placing it in the best possible physical condition for the germination of seed and the devel-opment of plant roots. The dry farmer thus stores water not in dams and artificial reservoirs, but right where it can be reached by the roots of growing

Through these principles a rainfall of Through these principles a railian of twelve inches can be conserved so effectively that it will produce better results than are usually expected of an annual precipitation of twenty-four inches in humid America. The discovers and demonstrator of these principles are and demonstrator of these principles. erer and demonstrator of these principles deserves to rank among the greatest of national benefactors. He has not merely made two blades of grass grow where only one grew before, but he has made it possible to cover but he has made it possible to cover with wheat and corn, alfalfa and other useful crops tens of thousands of square miles of fertile land on which nothing but sagebrush, cacti, Kansas sunflowers and bunch cross are now found

of the atmosphere condensed into drops large enough to fall with perceptible velocity to the earth. The variation in the sizes of the drops is dependent when the sizes of the sizes of the drops is depe pendent upon the difference in the height from which they have fallen and to the amount of atmospheric disturbance present at the time. If they fall from great heights the drops suf-fer gradual division into smaller and smaller parts until they are at last converted into mists. In calm weather, with the clouds near the earth's sur-face the drops. face, the drops are apt to be large face, the drops are apt to be large and heavy. The formation of rain is in general a continuation or an enlargement of the processes by which clouds and fogs are formed. The deposition of moisture depends upon the cooling of the atmosphere, but concerning cooling of the atmosphere, but concerncooling of the atmosphere, but concerning the precise process by which the cooling is effected various opinions are entertained even among those who have made meteorology a life study. In considering the matter we have deduced our reckonings from what is considered the best authority on the considered the best authority on the subject. From this it appears that the temperature of a given mass of warm air is lowered in the ordinary course of atmospheric phenomena by one or the other of the processes mentioned in the following: By radiation to the cold sky, by radiation to the neighbor-ing masses of clouds or the cold ground, by mixture with cool air or by the absorption of heat in the expan-sion of ascending columns of air.

ment experiments of a street publiments. The publiments of the absorption of according with cool air or by the absorption of a street procession of a street pro

A Joke.

The other day a benevolent old gentleman was stopped by a tramp, who asked for money for a night's lodging.

"Well look here, my man," the old gentleman said, "what would you say if I offered you work?" "Bless was if I offered you work?" if I offered you work?" "Bless yer life, sir," came the reply, "I wouldn't mind a bit. I can take a joke same as most people."
