Agriculture in Japan Farm Products at the Osaka Exposition-With Mr. Fisher in the Orient

(Written specially for the Farming World.)

In mountainous 'Japan only 12 per cent. of the land can be culti-vated. Still more than half of the population is engaged in agriculture, and probably more than onehalf of the national revenue is derived from the farming population. The display of Japan's farm pro-ducts made at the International Exposition at Osaka is interesting and highly creditable.

and highly creditable. On March 20th, the Hon Sydney Fisher made a careful examination of the agricultural exhibits, accom-panied by several of the important officials of the Exposition and my-self. The exhibits are generally very tastefully arranged, showing in great detail, not only all agri-cultural products, but also all plants grown for the arts and in-dustries. The exhibits are mostly grouped by provinces or "Keas," plantis grown to: dustries. The exhibits are mostly grouped by provinces or "Kens," large areas of country, something between our provinces and coun-tries. Each "Ken," as a rule, has a little court of its own, in which its exhibits are displayed. The southern the southern northern ken and the southern ken have products widely different, but nearly all of them showing quantities of staples, such as rice, soja and other beans. Many show tea and silk worm culture, others flax, but more hemp and reeds, for making mats.

Several of the northern kens show fine collections of apples, resnow nne collections of apples, re-sembling a good deal the coarser California apples, most of them with small spots, but of fine red color, good shape and large size. They, however, look coarse in tex-ture and are said to be so in fac-

JAPAN APPLES AND PEARS

ture, and are said to be so in flav-or. Some pears of a light brown or. Some pears of a light brown color, round in shape and quite large, are shown. These are coarse in texture and hard, though not of a bad flavor. A good deal of tobacco and rape seed is shown. From the latter oil is made for cooking and lighting purposes. The refuse after the oil is proceed out is used for memory.

The quality of the rice grown in the different provinces varys considerably. In some it is very fine, and in others coarse. Tobacco is and mothers coarse. Tobacco is grown very generally, most of it rather coarse leafed, a good deal like the French-Canadian article, but of a finer color. However, quite a lot of tobacco is grown from American seed, which is of better quality and is used for mak-ing cinerates. The hore second ing cigarettes. The home-grown is used for smoking. The Japan-ese do not chew tobacco, hence, none is grown for that purpose.

everywhere. The kernel is large, not of very good color, and looks soft. The barley is fairly good, and is used for both malting and to make meal, which is mixed with rice and used by the poorer people for eating. Some rye, grown in the southern island, is used in the same way. Indian corn is grown apparently successfully, but not to any large extent. It is not used for cattle feed at all. The soja bean is used almost entirely to make sauce, which is olly and sharp in flavor. A great deal of a small, dark-red bean is grown, and used largely for food. Very few oats are grown. We saw only one everywhere. The kernel is large, oats are grown. We saw only one sample that was fairly good. Buckwheat is grown largely in the north.

ROOTS AND VEGETABLES

Very few roots are shown. Some turnips of the white variety and various radishes and carrots, the latter very large. We saw pic-tures of cucumbers and squashes, but none of the vegetables. They are said to grow well. In one of the kens there is quite

a display of Tokai grapes and dried persimmons. The southern provinc-es show oranges. Some are large in size, like grape fruit. One lot in size, like grape fruit. One lot of California navel oranges is shown, also peanuts, ginger and ginseng. The last is used in Ja-pan as well as exported to China. The sugar shown was coarse and poor looking in quality. Indigo and the vegetable sponge are also grown. From one province are exhibits of plants for paper making. There is a large exhibit of etarch wade from notatoes and of starch made from potatoes and from rice.

LIVE STOCK

The Hokkaido sections where they have introduced American stock, machinery and methods, show some fine pictures of cattle show some fine pictures of cattle and horses, which, if true to na-ture, there must be some fine hords of Shorthorns, Ayrshires and horses. The army is largely sup-plied from horses raised in these sections. The number of crossbred horses have steadily increased during the past 25 or 30 years, while the number of pure-bred native stock is decreasing in about the same proportion. The beef in the large cities evidently does not the large cities evidently does not come from the northern provinces, where these imported cattle are. We hear of nothing but Kobe beef, which is fattened near the large centres. The cattle we see being drives to market in the streets have a market in the streets and an not unlike the Jersey OT adian cattle, but rather d coarser. The bulls, meigh over 1,000 lbs., and whi uite a lot of toolacco is grown for American seed, which is of better quality and is used for mak-arc cigarettes. The home-grown s used for smoking. The Japan-se do not chew tobacco, hence, is grown for that purpose. The Japanese fatten their beef cattle extremely well, and must kill them young, as weight over 1,000 Hbs., and singly in the streets of Tolkyo for draught purposes. The Japanese fatten their beef cattle extremely well, and must kill them young, as good. They are fattened chiefly
