

Antiphlogistine

(Inflammation's Antidote)

Is an Antiseptic Plastic Dressing

THE PROOF

Antiseptic: "Any substance having power to prevent or destroy putrefaction, accomplished by the prevention or destruction of the bacteria causing such putrefaction" - *Dunglison Medical Directory*.

I have frequently subjected parts of the skin which had been covered with this dressing (Antiphlogistine) to bacterial examination and found that they contained remarkably few microorganisms. Above all, the secretory ducts of the sweat and sebaceous glands contained few microorganisms, although in the usual method of sterilizing the skin the secretory ducts offer the most favorable recesses for the retention of bacteria. (Dr. F. Eddert, *Therapeutische Monatshefte*, Berlin)

Antiphlogistine is also:

- | Hygroscopic
- | Exosmotic
- | Endosmotic
- | Anhydrous
- | Heat Retaining
- | Pain Relieving
