

APPLE AND PLUM TREE, AND HIGH-BUSH CRANBERRY.

Pyrus, Prunus, and Oxyococcus.

The Apple and Plum tree, and High-bush Cranberry, are, to a certain extent, abundant in various parts of the Province, producing fruit, in size and flavor, equal to that imported from more genial climes.

WILD CHERRY.

Cerasus Americana.

Wild Cherry tree is found of a height of twenty-five feet. It is very abundant; but, as a wood, is not used for general purposes. The fruit is regarded as palatable.

CHOKO CHERRY.

Prunus.

Choke Cherry is found on the margin of streams, and in low, flat land, of a height of twenty feet. The fruit which this tree produces is a pulp enclosing a kernal, and is mostly used for cordials. The juice, which is obtained from the fruit by soaking in spirits, is very astringent, and makes excellent bitters.

BILBERRY.

Vaccinum.

This tree, if it may be so termed, grows to a height of thirty feet and upwards. It is found on the banks of streams and rivers, where the land is any wise of a good description. It is not very abundant, nor is it used for any general manufacturing purpose, though the wood is somewhat dense and very durable.
