

ridges rising on each side fifty to one hundred feet, and just where one would expect to find a cut terrace, but none were seen that could safely be put down as such. On the north-west side of Lake Doré there is a well defined gravel terrace at a height of four hundred and fifty feet above sea level and forty feet above the level of the lake.

A few sand and gravel ridges occur in this district, though none of any great length were seen. Two small ridges occur in Westmeath township. They are composed largely of sand and gravel, and are ten to fifteen feet high. They lie about S. 30° E. Another low ridge was seen near Caldwell Station on the Ottawa, Arnprior and Parry Sound Railway, though the material in this one is more of the character of boulder clay. On the road between Concessions XXI and XXII, Lot 12, Wilberforce township, just east of the stream from Green Lake there are four ridges running parallel to each other, course S. 23° E. The first is only a few rods from the stream which cuts through it south of the road. In this part it is very regular in shape and rises about twenty feet above the surrounding ground. Where the road cuts through it, it is about two hundred and twenty-five feet wide, flanked on each side by a low ridge four or five feet high. The sides are steep and meet in a sharp ridge at the top. Between the first and second ridges there is a peat bog two hundred feet wide. The second ridge is about the same size as the first, then another narrow bog, and the third crosses the road. It is similar to the other two only not quite as high. A short distance from this is a fourth ridge, but it is low and rounded at the top. A good section is shown in each where the road crosses. They are composed of well rounded water-worn pebbles, sand and gravel and a few angular fragments of rock, but the second one mentioned differs considerably from the others. A section in descending order is—rounded pebbles, sand and gravel, five feet; fine sand well stratified
