## CAPILLARY ELECTROMETER

Measurements of capacity in ...bes large enough to permit the measurement of wetted area yield a calculated thickness of the double layer substantially the same as that given by Lippmann.

If we admit the existence of a double layer, the change in capacity with the applied difference of potential seems to indicate a change in the thickness in the double layer brought about by the charges on the plates of the layer.

In conclusion, I have to thank Mr. A. L. Greenlees for his painstaking care in carrying out nearly all of the experimental work in the foregoing paper.

Physics Laboratory, Queen's University Kingston, Canada.
