

Fistula and Poll Evil

Any person, however inexperienced, can readily cure either disease with Fleming's

Fleming's Fistula and Poll Evil Cure

even bad old cases that skilled doctors have abandoned. Easy and simple; no cutting; just a little attention every fifth day—and your money refunded if it ever fails. Cures most cases within thirty days, leaving the horse sound and smooth. All particulars given in Fleming's Vest-Pocket Veterinary Adviser. Write us for a free copy. Ninety-six pages, covering more than a hundred veterinary subjects. Durable bound, indexed and illustrated.

FLEMING BROS., Chemists,
45 Church Street, Toronto, Ontario

Dr. Page's English Spavin Cure.

For the cure of Spavins, Ringbone, Curbs, Splints, Windgalls, Capped Hock, Strains or Bruises, Thick Neck from Distemper, Ringworm on Cattle, and to remove all unnatural enlargements. This preparation (unlike others) acts by absorbing rather than blistering. This is the only preparation in the world guaranteed to kill a Ringbone or any Spavin, or money refunded, and will not kill the hair. Manufactured by Dr. Fredrick A. Page & Son, 7 and 9 Yorkshire Road, London, E. C. Mailed to any address upon receipt of price, \$1.00. Canadian agents: om

Auction Sales of

Horses, Carriages, Buggies, Harness, etc., every Tuesday and Friday, at 11 o'clock.

Special Sales of Thoroughbred Stock conducted

Consignments solicited. Correspondence will receive prompt attention.

This is the best market in Canada for either buyer or seller. Nearly two hundred horses sold each week.

Shire Horses

We breed the very best and soundest, which from birth are kept in their natural condition, neither forcing nor overfeeding for showing purposes. Canadian buyers visiting England are invited to call and see what we have.

No fancy prices, and all delivered free Liverpool landing stage. Correspondence invited. om

Station: Althorp Park, L. & N.-W. Ry.

JOHN CHAMBERS & SONS,
Holdenby, Northampton, England
Clydesdales, etc.

To effect immediate sale I will offer some valuable stock at greatly reduced rates, far below their value. One 3-year-old Clyde stallion, good color; built like a draft horse, with the action of a Hackney, every joint working, at trot as well as walk; sire and dam imported. **Yorkshire Sows** now ready for service. Two **Short-horn** bull calves; also yearling heifers.

RICHARD GIBSON, Delaware, Ont.

For Sale: Imp. German Coach Stallion, **Kaiser Wilhelm**, prizewinner and sure stock-getter; present weight, 1,400 lbs. For full description, etc., write **W. J. HARRIS, Schomberg, Ont.**

the clippings being left on the field to form a mulch. This will check any weeds that may have put in an appearance, and also strengthen the plants, causing them to root deeper, which is an essential in getting them through the first winter, after which, with reasonable precaution, they will (with the exception of very hard winters) be safe. If this clipping is done early enough in the season, a crop of hay should be obtained the first year, care being taken, however, not to cut later than about the tenth of September (of course, varying with different seasons), to allow of an aftermath to form for protection from the winter, and to exclude the water from the crown, a condition which is so disastrous to the alfalfa plant. It should on no account be pastured the first year; neither closely cropped the second; and, except in unfavorable seasons, will produce three crops per season. The cutting should be done when the plants are about one-third in bloom; the hay, which should be shaken about as little as possible when dry, being put into coils before drying too much—the leaves, which are the most nutritious part of the plant, dropping off readily when allowed to become dry and crisp—and left to cure in the coil. This usually takes from four days to a week. The hay, unless spoiled in curing, is eaten up greedily by all kinds of stock, and when run through the cutting-box and mixed a meal ahead, with pulped mangels or sugar beets, or when dampened with hot water, makes an ideal cheap hog feed for the winter months. The writer has seen dry alfalfa hay fed in limited quantities to brood sows, which was eaten up readily.

If intended for a hog pasture, the field or patch should be located conveniently near the buildings, and divided into two or three sections, to allow of the hogs being changed from one to the other, giving it a better chance to grow than when grazed continuously, and enabling it to carry more hogs per acre. The number of hogs that an acre should pasture depends on the stand, the season and the size and age of the hogs. On an average, where the hogs are changed about every two or three weeks, or as often as growth necessitates, a good stand should furnish sufficient grazing for from ten to fifteen hogs per acre, from the early spring till about the middle of September. The hogs should be provided with plenty of shade and water, and, of course, should receive a ration of grain.

We hear considerable in alfalfa discussions of the cost of seeding as compared with red clover. Let us see: Alfalfa seed generally runs about the same as red clover, and, occasionally, a trifle lower; at present both are about the same price per bushel. If thirty pounds of alfalfa seed per acre be sown, about double the amount of seed is used that is ordinarily sown of red clover. Now, a seeding of red clover will produce one crop. If sown with timothy, we find in most cases but a small amount of clover in the hay the second year. Some fall pasturage is also secured, and in some cases a second crop is cut. A good catch of alfalfa, if properly cared for the first year or two, will remain seeded for five or ten years, and even longer. As to its interfering with crop rotation: If a field will continue to grow good crops year after year, provided the weeds can be kept subdued, why should it be plowed up in two years in order to practice crop rotation on that particular piece of land? Another complaint often launched is the difficulty encountered in breaking the sod. I might here say that this is more pronounced in a thin seeding, where the roots have reached a good thickness, than where the plants stand closer and roots are finer. An alfalfa-grower has recently advocated, in case of breaking up the sod, close pasturage in fall with sheep or other stock, repeating again in spring until June, when it will be in the best condition for breaking. Alfalfa sod is at all times considerably harder to plow than ordinary sod; and this reminds us that we seldom receive any great blessing without its being accompanied by some slight inconvenience. Again, we occasionally hear of a farmer who, having given it a trial, has reported unfavorably, when if facts were investigated they would reveal that it had been sown in small quantities along with other grasses; or, if sown alone, on ground in unsuitable condition, and the seed applied too sparingly. Just here the writer has a recollection of seeing, some
