DESIGNS. PLANS AND ESTIMATES FURNISHED ON APPLICATION.

The Internation of the plant, and the cross compound type, eylinders 20 inches and 38 inches, running were of them, of the cross compound type, eylinders 20 inches and 38 inches, running to 224 revolutions per minute develops 600 horse-power and is said to be the largest high-speed engine in this country. This pair of engines, patned white like the remainder of the plant, are as graceful and perfect in their operation as if they were built for beauty and not for power, While not in use for the fountains the engines charge the batteries of the fleet of electric launches which run about the lagoons.

Before following the electric current generated by the dynames to the lamps which illumine the fountains, it will be well for us to go to the source of our water power; for it must always be borne in mind that these effects are both electrical and hydraulic. The water is the body, the and hydraulic. The water is the body, the

ELECTRIC FOUNTAIN IN PLAY. formed by their combination. To find formed by their combination. To find where the water comes from we shall have to go to the pump house, a little way to the south, but just without Machinery hall. We enter, glance hurriedly about, and stop short in sheer amazement, just as westop at many other places in this exposition where they have displayed such mighty dimensions and forces.

There are four huge pumps here. They are astonishingly large. One is assigned especially to the service of the fountains, though the other three, any or all of them, may be used for this purpose; and this one is the leviathan of the lot, It rises before the eye like a six-story house, By actual measurement it is fifty-one feet high, and tworkman busy about its parts looks like a pigmy on a hillside. It is whatis known as a vertical compound low duty pumping engine. The Ligh-pressure cylinder five feet in "lameter. The stroke, 52 to the minute, is five feet long. Three smaller pumps are located near by, and the power of all together may be turned on the water mains in case of fire. How much water do you suppose these four monsters where the water comes from we shall have

severe Abcess Cured.

Look at one of these fountains during the day and you see a circular platform some 70 feet in diameter raised ten feet above the level of the basin, and the surface covered with iron chambers of bell shape. It is very commonplace and ugly, giving no hint whatever of the beauteousness of which it is capable. Underneath this platform is a water-tight chamber, and down there is the laboratory in which is prepared the magic combination of movement, mass, light and color.

Let us go down into this chamber. It is well lighted by great electric lamps, two or three attendants are here, and by a code of electric signals they are in communication all the time with a man who sits in the tower of Machinery hall, near by, overlooking the fountains and directing their operation as display occasions. He is also in communication by similar means with the men who manipulate the

It is a great responsibility that rests on is shoulders.
Into this chamber run the electric wires

from the four white dynamos, and one of the two 16-inch mains. The latter is here subdivided into a perfect labyrinth of

DETAIL OF JET ILLUMINATION. pipes. It looks like hopeless confusion down here among these hundreds of pipes, but as a matter of fact all is order, and describe for you the glorious spectacle produced by a combination of water jets of changing form and vivid electric lights of kaleidoscopic coloring. This is something that must be seen to be appreciated, or even understood. But imagine, if you can, a bouquet of gorgeous water flowers tising to a hight of 150 feet and changing their colors chameleon like as they fall; showers of rubies, pearls and amethysts; great sheaves of golden wheat; ferns in columns and sprays of water greener than moss in the woods. You have seen brilliant displays of fireworks, made with combustibles and explosives. They are very, very beautiful. But these hydraulic fireworks are infinitely more graceful, more alluring.

Though it is impossible for me to describe the effect I hope to give you a fairly satisfactory idea of the cause. I want to tell you something of the wonderfully complicated and ingenious machinery by which this rare spectacle is produced. Few of the multitudes of people who gather in that most glorious spot of the exposition, the central court, whenever the fountains are playing, realize the magnitude of the machinery and the mightiness of the forces that are operating, far away and underneath the ground, for their amusement.

Let us go first to the source of power, to

change the colors with kaleidoscopic rapidity. He may paint one set of streams in red and another in ruby. He may surround a red and vivid central palm with a circlet of a dozen golden wheat sheaves. He may cause one column of water to rise to a burst of sea-green and burst into a in a bust of sea-green, and burst into a shower of rubies. Do you begin to grasp the wonderful possibilities of this beauty-making device? Do you wonder that we who have seen it are enthusiastic in its precise.

who have seen it are enthusiastic in its praise?

How many combinations are possible with this magic factory? If you care to figure it, work out the permutation of twenty-six, the old problem which used to appear in our arithmetics as the number of combinations possible in the English alphabet. You may remember working for days and days at this mathematical task covering reams of paper with your for days and days at this mathematical task, covering reams of paper with your figures, only to discover at the end one little error early in the process had thrown you several billions cut of the way. With nineteen lamps and seven colors (inclusive of white produced clear and dazzling through ground glass) there are so many possible combinations in this device that a row of figures two inches long would not armers their number. express their number.

Nor is this all. The valves in the water mains and distributing pipes are so arranged the pressure can be "projected" or "pulsated"—the streams thrown with sudden force, like the bursting of fireworks, or be made intermittent in their action. These movements add vastly to the effects. Energy measured at 1,000 horse power provides the light, 8,000 horse-power the

pressure of water and a quarter of a million dollars the appliances with which this unparalleled delight to the eye is pro-From this description of the plant, mea From this description of the plant, mearinger and imperfect as it is, the reader will easily understand that when these two fountains are playing in the most glorious scene ever contrived by man—the palace surrounded, art-gemmed, electric-diamoned central court—the scene rivals in magnificence one's brightest dreams of a fete day in the golden city of the hereafter.
