But lo! the clouds have broke away—
 How glitter all the laughing rills!
 And glad proclaims the Robin's lay
 That May is coming o'er the hills!

Humphrey's Compound is the name of a species of manure which is so highly spoken of in some of the English Agricultural periodicals, that we feel warranted in recommending its being introduced into this province. It is stated in the directions, &c. that a single bottle is equal to some hundred weight of rich compost; and an experienced gardener affirms that he has in various instances applied it to sickly plants with most satisfactory effect; using at each application about a pint of water, to every tea spoonful of the composition.
