

*Endropia duaria* and *Ellopia fervidaria*, although appearing every season to some extent, were also unusually plentiful, and some dark coloured and heavily marked forms of them were obtained.

Although the season was not uniformly good throughout, yet it proved in the end to be one of the best I have had in many years.

The following names are new to the Canadian list:—

*Sarothripa Lintneriana*, Speyer. Determined by Prof. Fernald, was sent to him by me in mistake as a micro.

*Ædemasia nitida*, Pack.

*Dasylophia interna*, Pack.

*Panthea propinquinelinea*, Grote, or sp. nov. This specimen I took in 1892. I thought at the time that it was an indistinctly marked *P. furcilla*, but upon further investigation I concluded that it required authoritative determination, so I sent it to Prof. Smith, who returned the specimen with the following remarks about it:—"No. 37 is exceedingly interesting and is somewhat different from anything that I have ever seen before. It comes nearest to *Demas propinquinelinea*; but I never saw before one quite so well marked as this is. All the specimens from this region are a good deal more powdery and darker with very little contrast in maculation. I would not be at all surprised if a good series of both species would prove the Canadian form distinct."

*Hadena vulgaris*, G. & R.

*Oncocnemis viriditincta*, Smith. This is a species that I took a few specimens of at Hamilton, many years ago. It was given a name provisionally and placed with the named material. I had known for long that it was out of place, but forgot it when sending for names. So to avoid that again, I placed a specimen with the unnamed material, and it went to Prof. Smith, with others, in December last. When the Professor sent me the names of the others, he pronounced this one to be an "oddity," saying "It reminds me of some West Indian species," and suspected that it must have been a transient visitor. But upon assuring him that I had taken four of them, that I had seen more of them than I captured, and that they were not all taken in the same year, and on sending to him a male specimen for further examination, he wrote to me thus:
