

SUPERVISION.

The general scope of the supervision will include means necessary to ensure :—

1. The sanitary control of the dairy animals (including veterinary inspection and tuberculin test.)
2. The proper construction of the buildings at the farm and depots for the distribution of milk.
3. That the staff is free from infectious disease.
4. That there is a due supply of the proper apparatus for preserving the milk and cleansing the utensils.
5. That, where this is required by the conditions under which the business is carried on, or by the distance of the farms from Montreal, there be arrangements for Pasteurisation of the milk.
6. That the quality of the milk, both bacteriologically and chemically is maintained at the standard required by the Society, and that chemical preservatives have not been employed.

Information as to the result of analysis will be furnished to registered milkmen concerning their supply, to members of the Society concerning any supply, and thirdly as regards the milk used by them, to individual members of the general public who pay an annual subscription.

If fuller information is desired we will be glad to furnish you with the same, * and with copies of rules and instructions, as also with a copy of the contract provided for by the Society.

* In order that the Commission may afford you an approximate estimate of cost of supervision it will be necessary for us to have from you a statement with regard to the following points :—

- (a) Amount of milk delivered per diem.
- (b) Source or sources from which milk is obtained.
- (c) Methods of delivery, in bulk, bottles, or both.
