

The first part of the paper discusses the general principles of the theory of the atom. It is shown that the atom is a system of particles which are bound together by forces of attraction. The forces of attraction are of two kinds, one of which is the electrostatic force and the other is the force of attraction between the particles of the atom. The electrostatic force is the force of attraction between the positive and negative charges of the atom. The force of attraction between the particles of the atom is the force of attraction between the particles of the atom. The force of attraction between the particles of the atom is the force of attraction between the particles of the atom.

The second part of the paper discusses the general principles of the theory of the atom. It is shown that the atom is a system of particles which are bound together by forces of attraction.
