

expectorated freely and she steadily improved and made a perfect recovery.

In another case broncho-pneumonia developed in spite of the sub-cutaneous injection of 18,000 units of antitoxin. Tracheotomy was then performed and 22,000 units of antitoxin were injected intravenously. There was immediate improvement and prompt recovery.

Gentlemen, when we see how much can be done for malignant cases, am I not justified in stating that our death rate is too high?
