

of producing aloin from the different brands of aloes this drug has become very popular, and has taken the place of the crude drug to a considerable degree. Aloin enters into almost every emmenagogue pill and mixture. Its value as a therapeutical agent is so well known that it is not necessary for us to speak of it in detail, yet we desire to say that its addition to the drugs in question aids very materially in making "Ergoapiol" so valuable a combination. Being a mild stomach tonic, it aids in overcoming the irritable qualities of the savin; also acting as a hepatic stimulant, freeing the portal circulation and relieving the torpid condition of the lower bowel, it goes a great way toward relieving that condition so often present in diseases of women—pelvic engorgement. These qualities make it an ideal adjunct to the emmenagogues mentioned. Our attention was called to "Ergoapiol" (Smith) through a reprint from a St. Louis journal. This reprint gave the names of remedies entering into the combination. We at once concluded that this product would be a useful one, and securing a supply we began prescribing it wherever indicated. The results were even greater than we had anticipated. From the beginning we have kept clinical notes of each case, some of which will be recorded in this article. "Ergoapiol" is a mild, aromatic stomach tonic, anodyne, antispasmodic, and hepatic stimulant. It is also a laxative, an ideal emmenagogue in the full sense of the term, and exerts a decided tonic influence upon atonic conditions of the pelvic viscera. It is indicated to a greater or less extent in all forms of dysmennorrhea, viz., atonic, congestive, obstructive and membranous. In true obstructive dysmenorrhea due to actual stenosis of the uterine canal, to a sharp flexure of the organ, or to the valve-like action of a clot or a polyp, it is seldom indicated, because this form of organic dysmenorrhea requires either surgical operations or mechanical means to effect a cure. However, good results may be expected from its use after such operations have failed to complete a cure or to relieve the suffering. It is even useful in the form where clots cause the trouble by their mechanical obstruction, and we have seen its administration cause the passage of a polyp in one patient. Good results may be expected from its use in that form of dysmenorrhea known as membranous, due to an exfoliation of the endometrium in the form of a membrane. In amenorrhea it is far superior in value to any remedy we have yet tried, if the cases are properly selected. Amenorrhea due to taking cold at the menstrual period, or caused by shock, can be relieved with the remedy in question. This remedy is occasionally beneficial
