a photographic camera in combination with a secondary guiding way or, track ruising or lowering the front or back of the camera as the case may be, so as to keep the base line of the primarily attached subject matter, the focused lens and the base line of the opening exposure slide on the sensitived plate, all in one direct and straight line, whatever position the camera may occupy upon the main track or whether the lettering be focused large or small upon the the sensitived plate, 12th. In the art of obtaining surfaces for printing reading matter from, by means of an elastic band or surface to which the subject matter has been primarily attached and subsequently passed through an adjusting and shaping machine, in combination with a photographic camera giving at whatever position the camera may occupy in relation to the primarily printed subject matter, a width of opening exposure suitable to the ledgit of the lettering as focused upon the sensitized plate, whether large or small. 13th, In the art of obtaming surfaces for printing reading matter a photographic camera in combination with a secondary guiding way or, neigh of the retering as locased upon the sensitive pair. Whenever large or small; 13th, In the art of obtaining surfaces for printing reading matter from, by means of an elastic band or surface to which the subject matter has been primarily attached undexabsequently passed through an adjusting and shaping machine, in combination with a photographic camera as sensitized plate frame within the sensitized plate shield of the camera moveable equality at each exposure and uniformly with and to a similar width of lines as by at each exposure and uniformly with and to a similar width of line in the opening exposure slade, but remaining stationary at each shutting of the opening exposure slide. It is, in the composing and attaching machine the special combination, as follows: the combination of a fingering key a, the connecting attachments 23, a, 24 and p, a baree lever r and a paper clip t are ing as a single set, and the congregation of these sets in sufficient numbers to accomplish the purpose: 15th. The combination of a paper clip t, a spring c, a clip pointer 25 acting as a single set and the purched holes in the ribboned number and the sourcement of these sets in sufficient numbers t, and the sourcement of these sets in sufficient numbers t, and the sourcement of these sets in sufficient numbers t, accomplish paper, and the congregation of these sets in sufficient numbers to accomplish the purpose specified; 16th. The ribboned paper or other suitable material in purpose specific (i) that the runoing paper of one stituous material printed and punched, combined with the converging paper or channel bbb, the shears d, and clastic band w; 17th. The combination of the flugering keys a a, the spring p the cross bar b the v ut of lever f, the connecting rod g and the shears d; 18th. The flugering keys a a a and the knee lever r by their connections combined with the cross bar v, the connecting rod k, the crank lever f and the friction cain a; 19th. The knee levers r each and collectively. and the cross bar r having relevance to graduated distances between them at y, corresponding to the width of their respective designated letters, figures, or points combined with the feed motion mechanism: 20th. The springs 26. or points commined with the feed motion incentions. 2006 The springs 20.
20 and m; 21st. The feed motion of a machine composing and attaching the subject matter to an elastic band, a friction can or cams or friction knee folat operating directly or indirectly upon the clustic band by suitable mechanism so as to produce a variety of feeds suitable to the various widths of letters. &cc; 22nd. In the photographic machinery, the special combinations, as follows: the clustic band or surface ic to which the subject comminguous, as forouse the easier and of surface of which has subject matter has been primarily attached, combined with the feeding rollers 205 205 and the shaping and adjusting machine 52–23rd. The clastic hand or surface to which the subject matter has been primarily attached, combined with the knee joints or friction cams 545-549, 24th. The clastic band or surface to to which the surface matter has been primarily attached, combined with the lever 23d and its scale 28, also with the levers 214 and 216 and their scales 246 245; 25th. The combination of the shaping and adjusting machine 52 246 214; 25th. The combination of the shaping and adjusting machine 52 and the way or track 37, with a recorded register of type sizes thereon, also the camera 33 with a recorded register of type sizes thereon; 26th. The combination of the increasing lever 27, the opening exposure slide 35 and the fron frame 32 connecting both, 27th. The combination of the opening exposure slide 35, the knee joint or triction cams. 31a, 31b, the friction bars 34a 31b, the frame 53 to which they are attached, and is contained sensitized plate 30, all and each of them, 28th. The combination of the clastic band 0, the camera 33, the opening exposure at 50 and the moveable sensitized plate 30, 29th. For the purposes of obtaining various sizes of lettering and a correct focus thereof, the combination of pointers 32 and 48 on the camera with their respective scales or registers of type sizes; 30th For the purposes of Justification and making various lengths of times, the classic band o with the subject matter attached, the pointer shields 5, 5, and the recorded scale 60; 31st. The combination of a box 61, the adjustable ornamentations, screen 60; 31st. The combination of a box 61, the adjustable ornamentations, screen, flucy lettering and other slides contained therein, and the cluste band to having the subject matter attached thereto, 32nd. The combination of the secondary track 42, the clastic band to the less 39 and the base of the opening secondary trace 42, the ensure manner the tension and the cover of the operation of the castic band two with the clastic and pliable contorting guide 50; 34th. The combination, in the feed motion, of the sensitized plate in the camera, of a feeding friction knee joint or cam 310 with a check friction knee joint or cam 315, the combination of both with and operating upon a smooth feeding surface, he it curved or be it straight; 35th. In muchinery for printing and punching ribboned paper, the combination as follows: In a printing press, printing and punching coils or strips of ribboned paper, the combination of the printing with the punching in one and the same operation and time; 36th. The combination of a discharging rec, \cdot and the ribboned paper ϵ with the printing wheel a, its type 28 and its punches 20 operating in and open the wheel b for the purpose of producing the result. 37th. The combination of a discharging reel d with the wheels a and b; 38th. The combination of the receiving reel d with the pinion wheel a, the cord to and the weight p; 38th. The combination of the guiding and pressure roller i, and of the pressure roller j with the ribboned paper ϵ , for the purpose of guiding and keeping down the ribboned paper against the pressure wheel b; 40th. The combination of the type 28 and the punches 20, in the printing wheel a with the heles 21 and the pressure wheel b in which they are; 41st. The combination of the ribboned paper ϵ printed and punched with the receiving and winding reel d. and operating upon a smooth feeding surface, be it curved or be it straight;

No. 7396. Machinery and Process for obtaining Printing Surfaces.

(Machine et procédé pour obtenir des planches à imprimer.)

George P. Drummond, Ottawa, Ont., 29th April, 1877, for 5 years.

Claim.—1st. The art of obtaining surfaces for printing reading matter from, by first impressing from a 15 pe writing, printing or setting machine, the subject matter on an elastic band or surface, and afterwards transferring the same, by any photo mechanical process, to metal, stone or other surfaces for printing (20d The art of obtaining surfaces for printing reading matter from, by first impressing from a type-writing, printing or setting machine, the subject matter on an unclastic band or surface, and afterwards transferring the same by any photo mechanical process, to metal, stone or other surfaces for printing (3rd The art of obtaining surfaces for printing reading matter from, in reference to the justification thereof, firstly by straning an clustic band or surface on which the subject matter has been primarily

printed, so as to clongate the subject matter within certain limits or lengths of lines, according to conventional practices among printers, and secondly to contractor clongate the subject matter by turning the clustic or unclasses band or surface upon which it has been primarily printed, to any desired angle in the same plane with the camera, and then transferring enter or both by any photo-mechanical process to metal, stone or other surfaces for both by any photo-mechanical process to metal, stone or other surfaces to printing; 4th. The art of obtaining surfaces for printing reading matter from, by angling, shaping or contorting an clastic band or surface on where the subject matter has been primarily printed so as to impart varieties of shapes and designs to the lettering, which then by any photo-mechanical processare transferred to metal, stone or other surfaces for printing over or along side the subject matter which has been primarily printed upon or other surfaces for a printing over or along side the subject matter which has been primarily printed upon a lastic or implicate hand or surface, any screens, letter, or our containings. over or atongstact the subject matter which has been primarily Printed upon in clastic or unclastic band or surface, any screens, letter, otneracidations, designs, whether black, white or any color, or transparent, or by intervia-ing between the lines of subject matter as they are photographed, any orna-mentations, pictures or designs, which combinations, by any photo-increhand-process, are then transferred to metal, stone or other surfaces for prioring 6th The art of obtaining surfaces for printing reading matter from by increasing or decreasing the distance between the sensitized plate in the camera and the subject matter primarily printed upon an clastic or unclastic band or surface, so as to produce various sizes of tettering, intermingted or main or surface, so us to produce various sizes of fettering, interimigied to otherwise, which then, by any photo-mechanical process, are transfered to metal, stone or other surfaces for printing; 7th. In the art of obtaining surfaces for printing reading matter from, and the foregoing manner of effecting it, a composing printing and transferring machine having flugering keys, operating type of soft or hard metal, or letter representations or the various letter of the surface and the surface of t ting type of soft of hard metal, or letter representations or the various electrof the alphabet, punctuation points, figures, and all other sigus necessary to the production of reading matter of any kind, oy means of which machine reading matter may be rapidly composed and transferred or printed darsets or indirectly upon a band or surface of any clastic or unclustic material, directly, by aid of an inking roller upon the surface of the elementary type if indirectly, by the intervention of the impression on lead, wood or other material in relief or intaglio, which received impression is then transferred to the clustic or une astic band or surface, printed thereon by Ordinary process of in him realies and treasure. Still in the art of abstrainer surfaces for process of in him realies and treasure. Still in the art of abstrainer surfaces for process. of inking rollers and pressure; 2th. In the art of obtaining surfaces for printing reading matter from these inbination of a hand or surface of any classic or unclastic material on which has been printed the subject matter, with a machine for adjusting and shaping it, movable as a whole upon a central and vertical axis and in that part through which the continuing line of substantial transfer beginning to the continuing line of substantial transfer beginning to the continuing line of substantials that the continuing line of substantials have beginned by the continuing line of substantials have beginning to the continuing line of substantials and continuing line of substantials are substantially as a substantial transfer leads to the continuing line of substantials are substantially as a substantial transfer leads to the continuing line of substantials are substantially as a substantial transfer leads to the continuing line of substantial transfer leads to the continuing line of substantials are substantial transfer leads to the continuing line of substantials are substantial transfer leads to the continuing line of substantials are substantially as a substantial transfer leads to the continuing line of substantial transfer leads to ject matter is horizontally passed upon a horizontal axis, by means of which movements the subject matter may be readily chared at a variety of angisto the sensitived surface of the camera, 9th. The art of obtaining surfaces for printing reading matter from, and the foregoing machinery and manner for effecting it, and shaping machine operating an elastic or unclastic basis or surface on which the subject matter has been primarily privited. in combnation with a photographic camera, and any photo-mechanical process or printing contained in the third, fourth, fifth and sixth claims and in general printing contained in the third, fourth, fifth and sixth claims and urgazeral the reproduction upon a sensitized plate or plates by means of platography any reading matter or its make up in any shape, printed on, attached to or lying upon an clastic or unclastic band or other surface, or substantially set torth and described, letter by letter, word by word, sentence by sentence, here by line, or lines by lines in succession or in whole or in part, and the reading matter justified, arranged and reproduced thus, transferred to metallic or other surfaces or lithographic stones, for printing by any known photomechanical process: 10th. In the art of obtaining surfaces for printing reading matter from, by means of an clastic or unetastic band or stotace on which the subject matter has been primarily writted; a photography mg matter room, by means of an easier or a measure and or so lace we which the subject matter has been primarily printed; a photographic camera in combination with a guiding way or track and an adjusting and shaping machine thereto; 11th, in the art of obtaining surfaces for printing reading matter from a photographic camera in combination with an in scribed or recorded set scale or detailed list of the various sizes of type upon the content of the printing states of type upon its own way or track or focusing draught and a corresponding and proportionately inscribed or recorded scale or detailed list of the various sizes of tomately inscribed or recorded scale or detailed list of the various sized type upon the guiding way or truck connected with the shaping or adjusting machine, for the purpose of readily increasing or diminishing and focusing and thereby obtaining all sizes of printing from the object reading matter primarily printed on an elastic or unclassic band or surface, many elementary or standard size by a type printing, writing or setting macoine, whether the object reading matter be plain or freated Lincifully, 12th. In the art of obtaining surfaces for printing reading matter from, by means of an easier or unclastic band or surface, on which the subject matter has been primarily and the consequence of the contract of the subject matter has been primarily and the contract of the subject matter has been primarily and the subj pricted and consequently passed through an adjusting and shaping machine a photographic camera, in combination with a secondary guiding maximize a photographic camera, in combination with a secondary guiding way of track, raising or lowering the front or back of the camera as the case may be, so as to keep the base line of the primarily printed subject matter the focus lens and the base line of the opening exposure slide on the sensuare plate, all in one direct and straight line, whatever position the camera may occupy upon the main track, or whether the lettering be focused large or small upon the sensitized plate. 13th. In the art of obtaining surfaces for printing reading matter from, by means of an elastic or unclastic band or surface, on which the subject matter has been promain printed and subsequently passed through an acting and shaping is chine, in combination with a photographic camera, an exposure ode in the plate, bight of the subsequently passed. chine, in combination with a photographic camera, an exposure ode in the plate shield of the photographic camera giving, at whatever position the camera may occupy, in relation to the primarily printed subject matter, a width of opening exposure suitable to the height of the lettering as focused upon the sensitized plate, whether large or small. His In the art of obtaining surfaces for printing reading matter from, by means of an elastic or unclustic band or surface, on which the subject matter has been primarily printed and subsequently passed through an adjusting and shaping machine, in combination with a photographic camera; a sensitized plate frame within the sensitized plate shield of the camera, movable equally at each exposure and uniformly with and to a similar width of the as the opening exposure slide; but remaining stationary, at each shutting of the mening exposure slide; but remaining stationary, at each shutting of the mening exposure slide; but remaining stationary in teach shutting of the opening exposure slide; but remaining stationary at each shatting of the opening exposure slide, 15th, in a composing, printing and transtring machine, printing reading matter, a key hoard of keys representing the various letters of the alphabet, having the vowels in one or two sets, each set in a body, placed at one or at both ends of the key board and taxing their attached type in a corresponding position, such arrangement being for the purpose specified, 16th. The combination of the keys c.c., the type reds a a.g., the arms 20 and the connecting rods 50 and 57, 17th, The combination of the keys c.c. and their attached arms 2 with the hother rods 10 and the of the keys cc, and their attached arms zz with the buffer rods 10 and the buffer 11 by their connecting rod 58, 18th. The combination of the rapidly revolving crank 12, the connecting rod 59 and the buffer 11, 19th. The
