FOOD SOLIDS

In a soluble, non-coagulable and diffusible form, are presented in **PANOPEPTON**—solids derived from the digestive conversion of whole wheat and lean beef under physiological conditions.

In the feeding of the sick, **PANOPEPTON** has a "value" quite apart from, and beyond, that of the native foods from which it is prepared, the far reaching significance of which is best summed up in the facts—that digestion is a complex, active, vital process; that digestion demands energy; that in disease unassimilated food may cause profoundly disturbing and even toxic effects.

Literature describing **PANOPEPTON**, its composition and analysis, will be sent to physicians upon application.
