Footnotes to the foregoing summary:

¹Description—The Standard Industrial Classification (SIC) is the basis for the classification of data in the CALURA (Part I) Reports. It is not used in its entirety because results for many classifications are of doubtful value. For example, most agricultural activity is carried on by unincorporated businesses or by concerns which are otherwise exempt. Other classification problems which concern the format in which source data is received inhibit complete adaptation of the SIC. The most detailed level of classification which is feasible is that employed in the 1967 Report. The data of this table is largely derived from that report.

²Assets—Included are the reported assets of all corporations which filed income tax returns for fiscal years ending in 1967 with minor exceptions in the insurance industry.

³% N.R.O.—This is the proportion of the assets of the classification which were reported by corporations in which at least half of the voting shares were owned by non-resident individuals or corporations with non-resident addresses.

⁴% U.S. Control—This is the proportion of the assets of the classification which were reported by corporations which were controlled by residents of the United States. Residents in this sense include both individuals and corporations.

⁵N.R.O. Increasing—If the proportion of non-resident interest in the classification appears to be increasing, an 'X' appears in this column.
