

precipices, and accessible only by three ways, cut with labour out of the cliffs. The soil below is fertile and well cultivated, producing copious harvests of wheat and Indian corn. The inclosures are adorned with hedge-rows of Lombardy poplars, which rise in pyramidal shapes, and exhibit a pleasing appearance. The gloomy faces of the surrounding rocks are shaded and varied by evergreens, consisting of laurels, myrtles, fayus, pao-sanguintro, tamujus, uvæ de serra, and a number of other shrubs and vines. Streams of crystalline water, interrupted in their downward course, dash with impetuosity and foaming fury from rock to rock, and collecting in deep, stony basins beneath, thence issue in serpentine rivulets, which intersect the valley in a variety of directions; in some situations, rushing on with murmuring sound; in others, creeping along with a smooth and silver surface. These, together with the appearance of the boiling fountains, from whence clouds of steam are continually thrown up; a lake, well stocked with water-fowl; blackbirds, and other feathered songsters of the grove, enlivening by their melody; fruits, and aromatic plants, yielding the most grateful odours, contribute to form a combination of objects, highly pleasing, and wildly picturesque.

The valley, which is named Furno, contains a number of boiling fountains; the most remarkable of these, the cauldron, is situated upon a small eminence, being a circular basin of thirty feet in diameter, whose water, boiling with ceaseless agitation, emits a quantity of vapour. At a few paces distant from hence is the cavern Boca de Inferno, throwing out, for a considerable way from its mouth, quantities of water mixed with mud, accompanied by a noise like thunder. Around this spot, and within the compass of an acre of land, there are upwards of a hundred fountains of the same kind; and even in the midst of a rivulet which runs by it, are several of these springs, so hot as to be insupportable to the touch. In other places the sulphureous vapours issue with such force from a number of apertures in the overhanging cliffs, as to suggest to the fancy an idea of the place being inhabited by a thousand fabled Cyclops, occupied with their bellows and forges, in fabricating thunder. The surface of the ground is covered in many places with pure sulphur, which has been condensed from the steam, and which, like hoar frost, is arranged in sharp-pointed, stellated figures.

Not far distant from these hot springs, there are others of a nature extremely cold, particularly two, whose waters possess a strong mineral quality, accompanied by a sharp, acid taste. About half a mile to the westward of this place, and close by the side of a river, there are likewise several sulphureous fountains, whose waters have been used with eminent success, by
