Tumor of the Middle Lobe of the Cerebellum.*

BY D. C. MEYERS, M.D., TORONTO.

THE history of the case is as follows: The patient, H. W——, aged 26, is unmarried and a dentist by profession. In regard to his family history, his father and mother are alive. He has several brothers and sisters, all of a decidedly nervous temperament. His grandfather died of hemorrhage of the lungs, and there was consumption in his grandmother's family. His father tells me that one of his children by the first wife died of hydrocephalus, and another of consumption. No history of fits or mental disease. The patient's previous health was always good, but he was nervous, and at times was troubled much with headache. He had rheumatism about eight years ago, and some kidney trouble soon after. He has been much confined to his office since he was sixteen.

His present illness began about five years ago after an excess of work from taking his diploma. At this time he had an attack during which he was entirely paralyzed, and was unconscious or partially so for ten days. His temperature was raised to 103° at times during the
