Dectron manufactures the well-known DRY-O-TRON series of dehumidifier systems used to meet the exacting requirements for humidity control in North America's major indoor swimming pools, whirlpools, spas and hot tubs.

The DRY-O-TRON DS is a unique dehumidifier and water heater closed loop energy recycler that combats the problems of excessive humidity in indoor swimming pools, spas and whirlpools. The DRY-O-TRON draws in the warm humid air created by the evaporation of pool water and, by means of condensation, extracts the moisture and absorbs the latent heat for transfer to the pool water to keep it at the desired temperature. The drawn-in air, warmed by the heat of the DRY-O-TRON compressor is recycled to the pool area. The highly efficient DRY-O-TRON significantly reduces pool operating and maintenance costs and prevents building damage caused by moisture and condensation.

Dectron dehumidifiers are designed for humidity control in residential and municipal indoor swimming pools, spas and hot tubs.

The coil spacings and flow velocity of the Dynamic Separators Air Filter are available with 2.5 cm (1 in.) and 5 cm (2 in.) panel thicknesses.

The Dectron DS Series dehumidifier is designed for high humidity control in indoor swimming pools, spas and hot tubs.
