

HORSFORD'S ACID PHOSPHATE

VS.

Dilute Phosphoric Acid.

The attention of the profession is respectfully invited to some points of difference between Horsford's Acid Phosphate and the dilute phosphoric acid of the pharmacopœia. Horsford's Acid Phosphate is a solution of the phosphates of lime, magnesia, potash and iron, in such form as to be readily assimilated by the system, and containing no pyro- or meta-phosphate of any base whatever. It is not made by compounding phosphoric acid, lime, potash, etc., in the laboratory, but is obtained in the form in which it exists in the animal system. Dilute phosphoric acid is simply pho-phoric acid and water without any base. Experience has shown that while in certain cases dilute phosphoric acid interfered with digestion, Horsford's Acid Phosphate not only caused no trouble with the digestive organs but promoted in a marked degree their healthful action. Practice has shown, in a great variety of cases, that it is a phosphate with an excess of phosphoric acid that will better meet the requirements of the system than either phosphoric acid or a simple phosphate. "Phosphorus," as such, is not found in the human body, but phosphoric acid in combination with lime, iron and other bases, i.e., the phosphates, is found in the bones, blood, brain and muscle. It is the phosphates and not the simple phosphoric acid that is found in the urine after severe mental and physical exertion, or during wasting diseases.

We have received a very large number of letters from physicians of the highest standing, in all parts of the country, relating their experience with the Acid Phosphate, and speaking of it in high terms of commendation.

Physicians who have not used Horsford's Acid Phosphate, and who wish to test it, will be furnished a sample on application, without expense, except express charges.
