

RATION FOR YOUNG PIGS.

For the first feeding of young pigs, middlings, finely ground sifted oats and skim milk will be found excellent. Later on, say at three months of age, a mixture of middlings, 2 parts; finely ground oats, 2 parts; corn, 1 part; and skim milk may be used.

Here again, exercise is essential, care being taken that the youngsters do not get too fat from over-feeding and lack of exercise, with the ensuing ailments.

A FATTENING RATION.

An economical feeding ration is as follows:

Equal parts of shorts, ground oats, and ground corn, with 5 lbs. of skim milk per pig per day, and all the clover or alfalfa pigs will clean up. Where such a ration has been used, skim milk has been shown to be worth all the way from 28c. to 79c. per cwt. Green-cut clover similarly may be made worth \$4.50 per cwt. Are you utilizing these feeds to the best advantage?

IN GENERAL, for all classes of stock, where natural conditions are altered, strive to approximate the same. PALATABILITY, DIGESTIBILITY and POWER TO INCREASE PRODUCTION are the prime factors of all rations, viewed from the standpoint of economy and animal health.
