grounds are nearly sufficient, though the barn would be better protected with the three, which number we will decide on using. The next consideration is the location of grounds. Grounds should not be near doors or manure piles or small yards or paddocks, if any are adjacent to the barn for exercising stock.

Other conditions being satisfactory, grounds are best located at the corners where the cave pipes run the water to the earth, as the soil is sure to be wet at that point. Sometimes the conductors are carried
